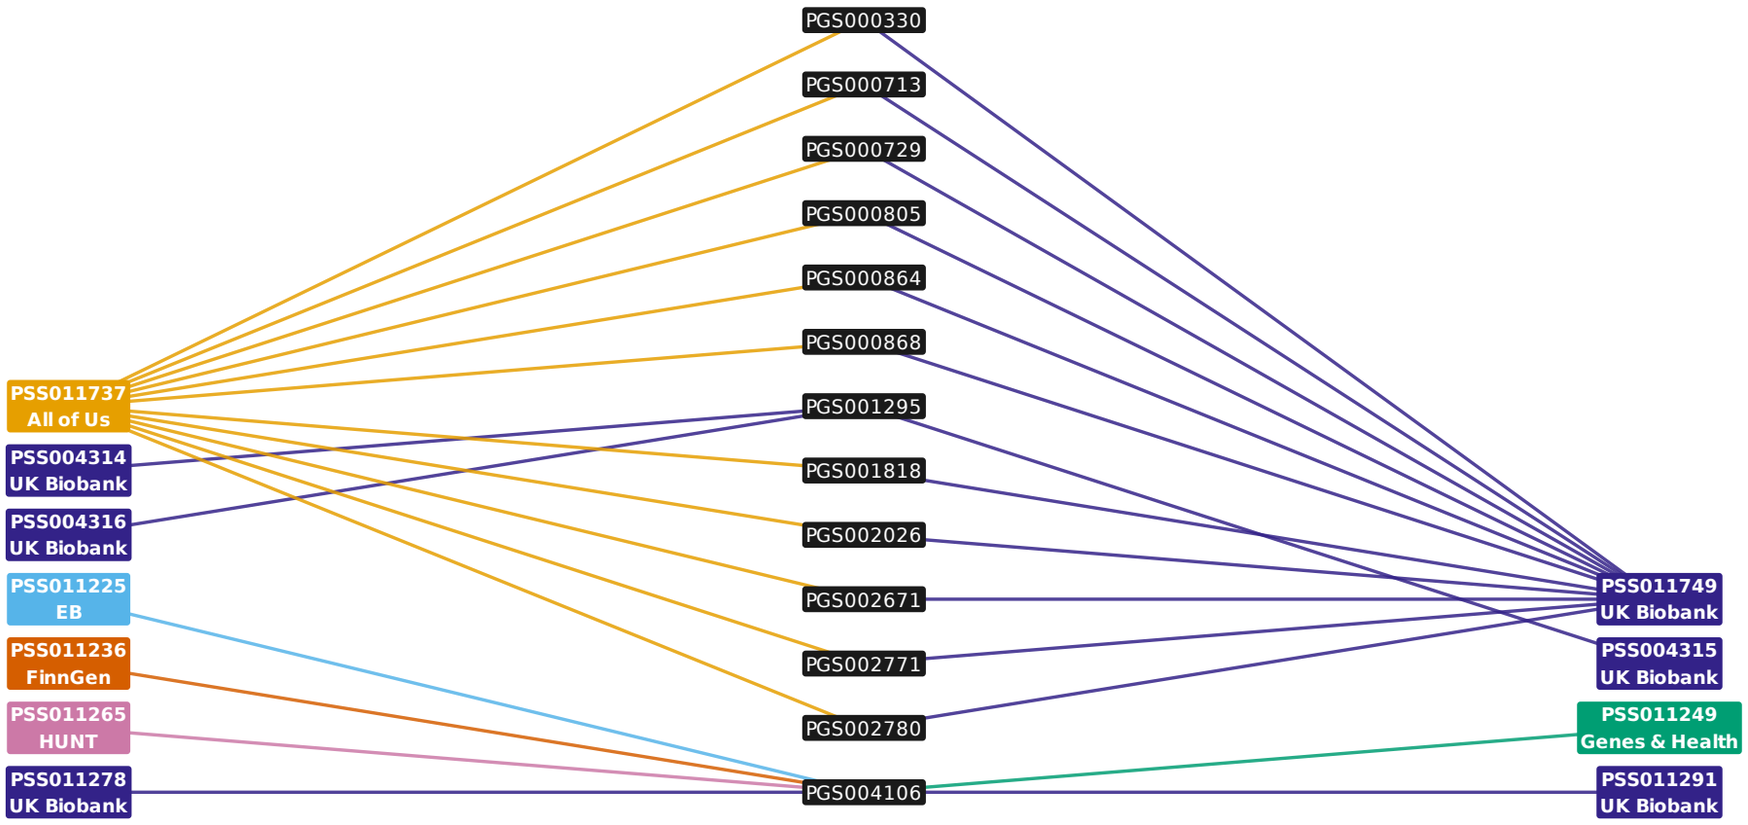
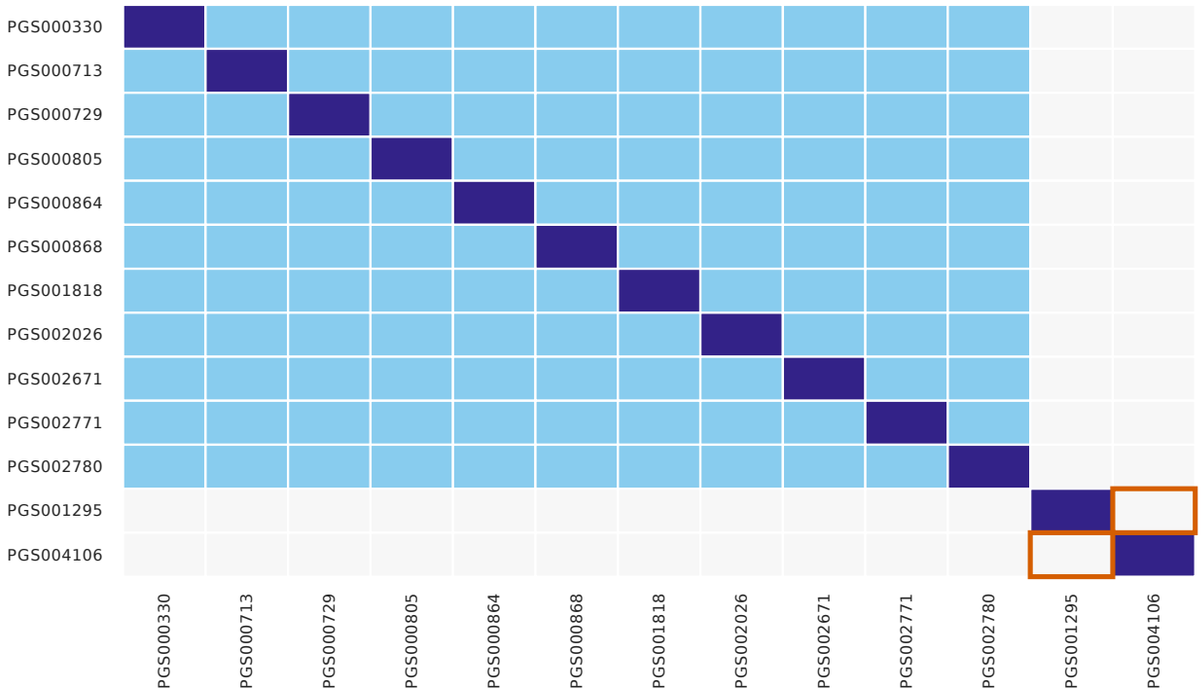
3. From sample sets to correlation

Type 2 diabetes, South Asian participants, European-only training. A grid entry is the correlation vcalc uses: 1 on the diagonal, 0.6 for a shared label, 0 otherwise.

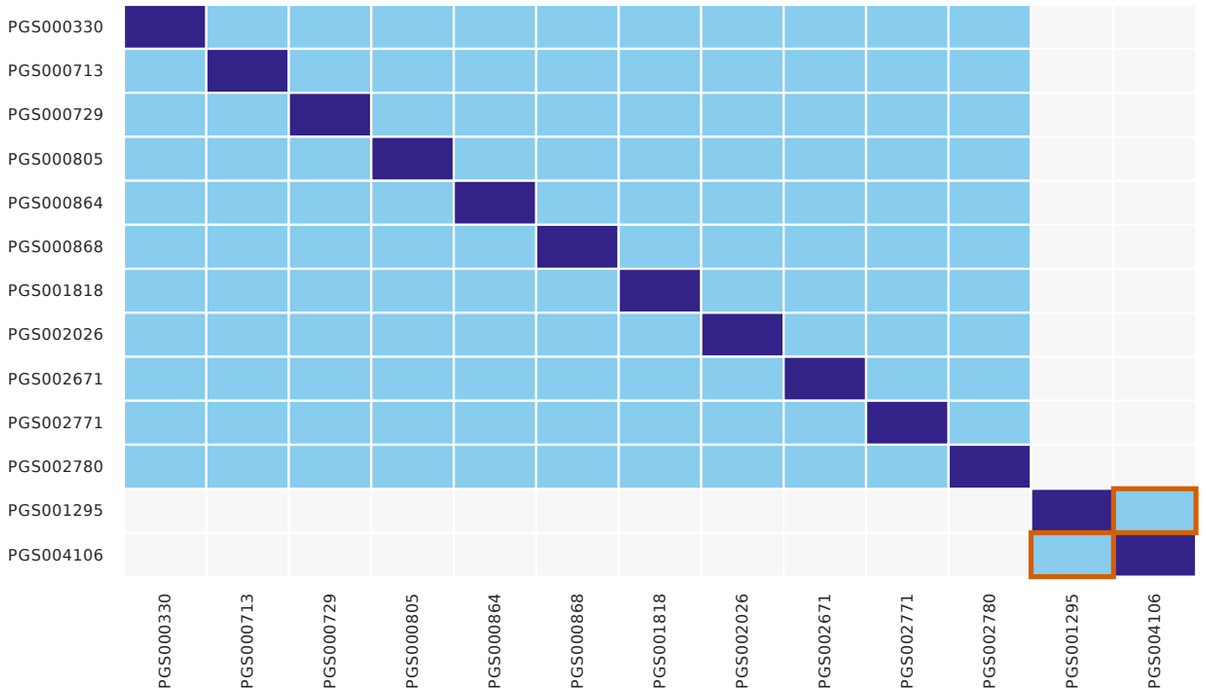
Who shares a sample set



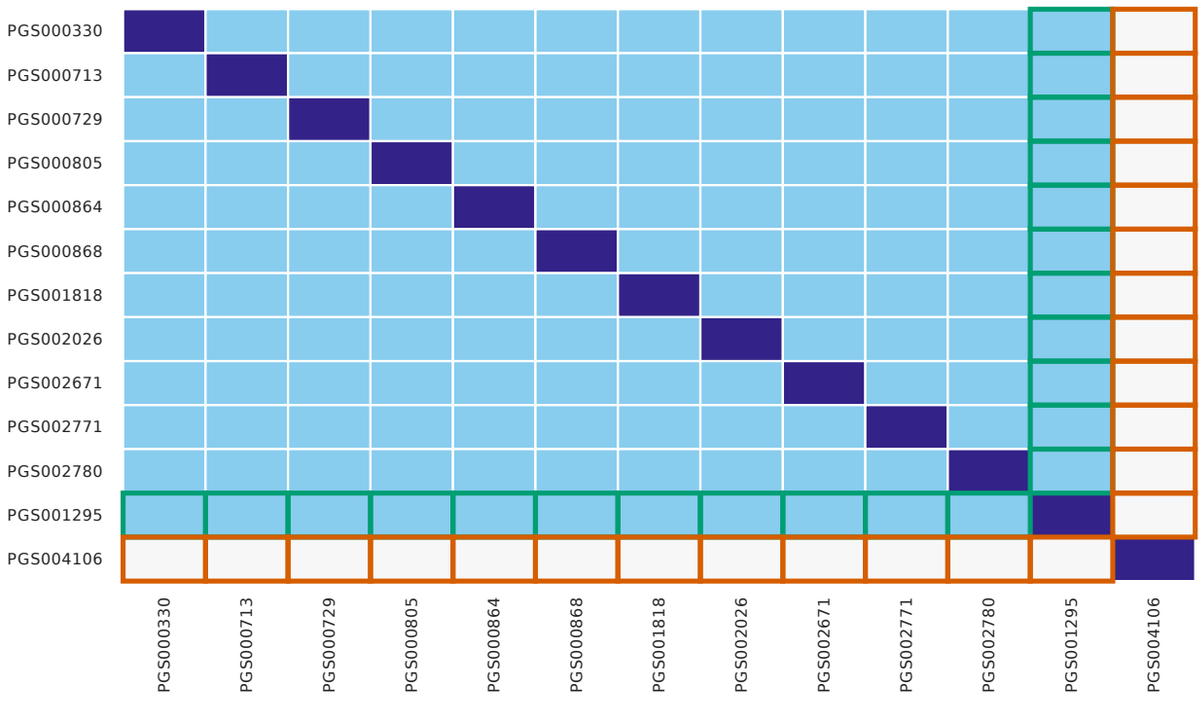
European side, same exact label



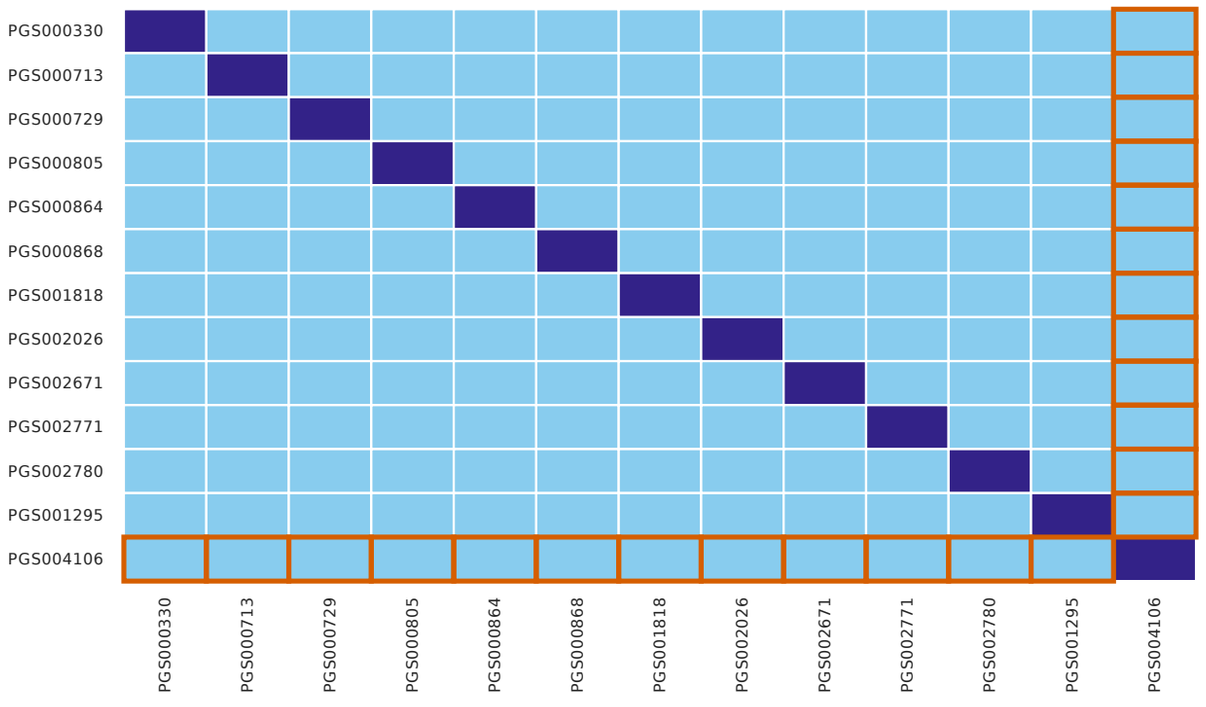
European side, shares any study



Non-European side, same exact label



Non-European side, shares any study



Colour in the top panel is the study. The model treats two sample-set ids of one colour as the same people. PSS011749 and PSS004315 are different sample sets with the label UK Biobank.
Orange outlines mark pairs where the two grids on that side disagree. On the non-European side those pairs are PGS004106 (Genes & Health + UK Biobank) with each of the other twelve. On the European side the pair is PGS004106 (EB + FinnGen + HUNT + UK Biobank) and PGS001295 (UK Biobank).
Green outlines on the non-European exact-label grid mark PGS001295 with the eleven: the labels agree, and the sample sets do not.
The linked fit uses chained groups. For this comparison those groups are the same pairs as sharing any study.
