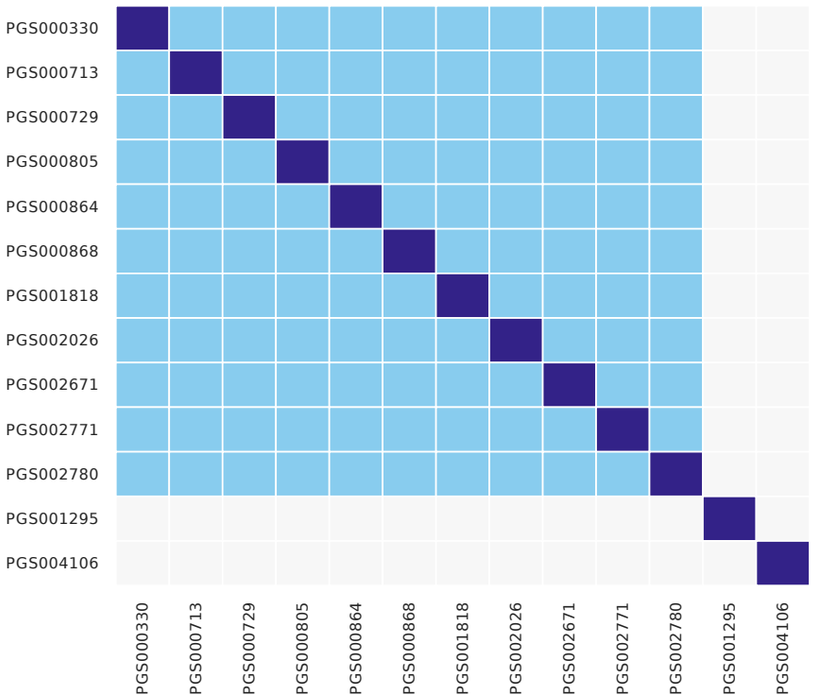
4. Building V

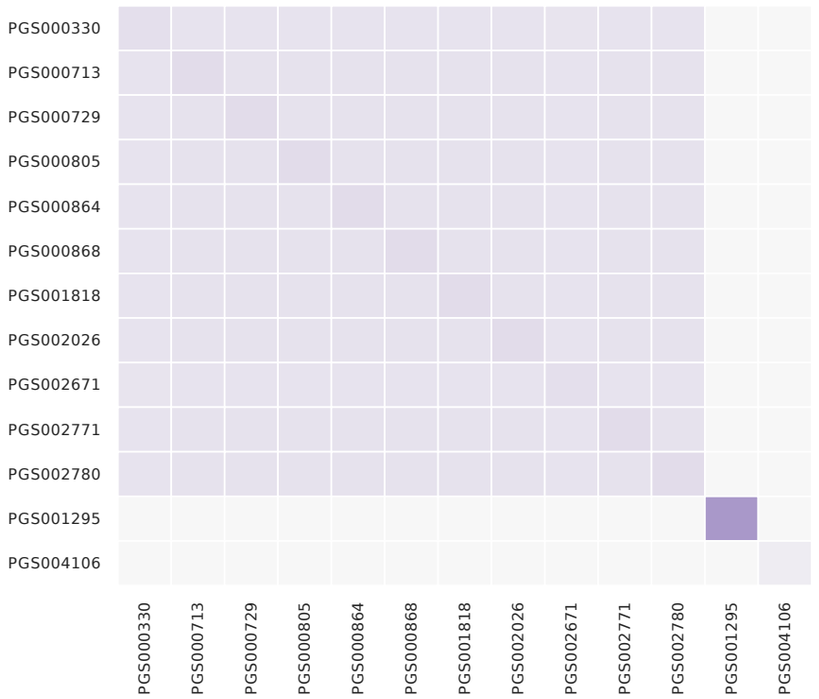
Type 2 diabetes, South Asian participants, European-only training. ρ = 0.6.

European correlation

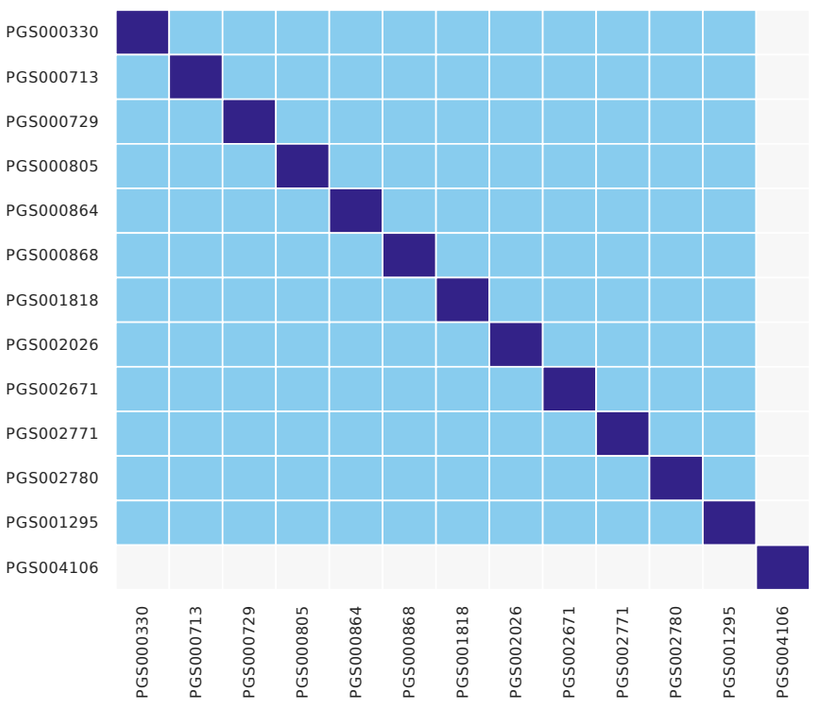


European standard error

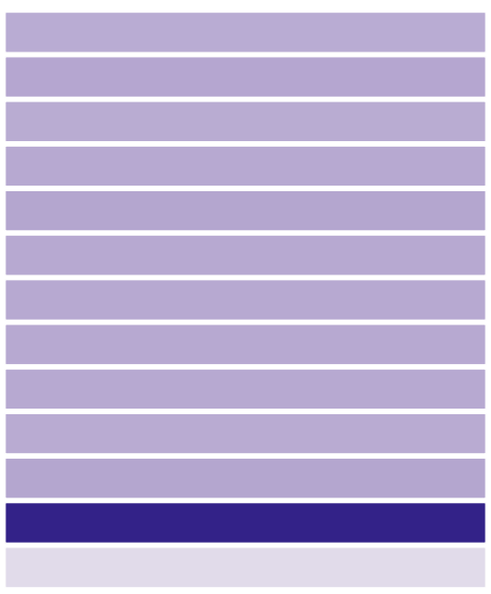
European covariance



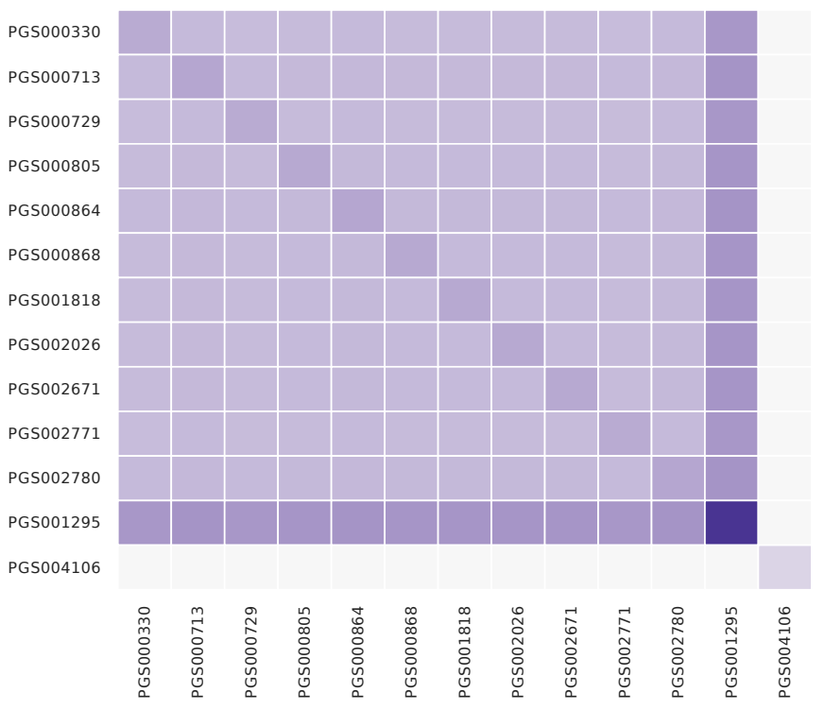
Non-European correlation



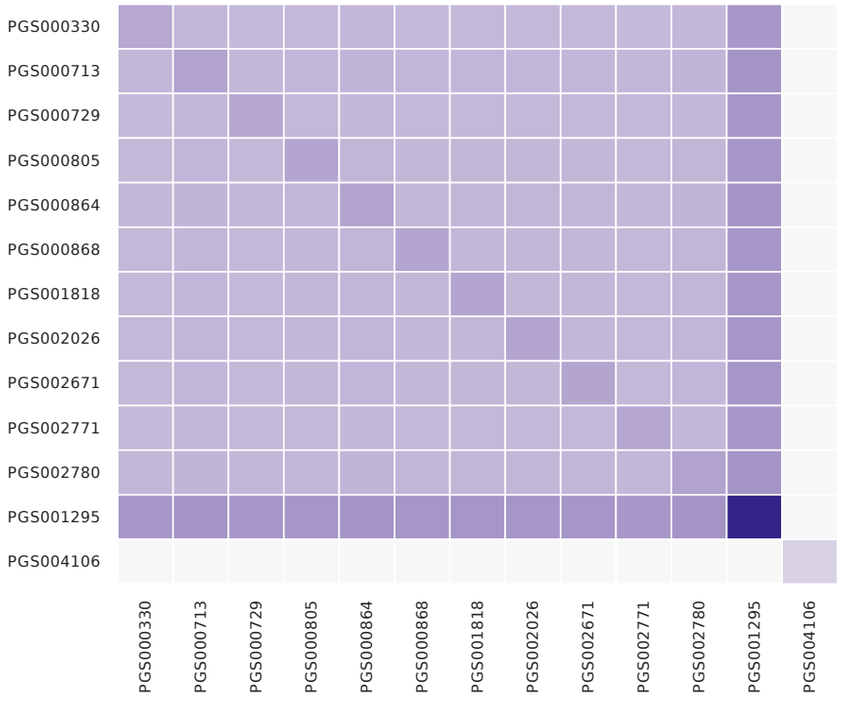
Non-European standard error



Non-European covariance



V, the sum



The correlation pattern is who shares a label: 0, 0.6, or 1. The standard error is how large that share is in the covariance. The European standard errors are small, so that block is faint. V is the sum of the two covariances. Colour within the covariances is on a square-root scale and is shared, so the sizes can be compared.
