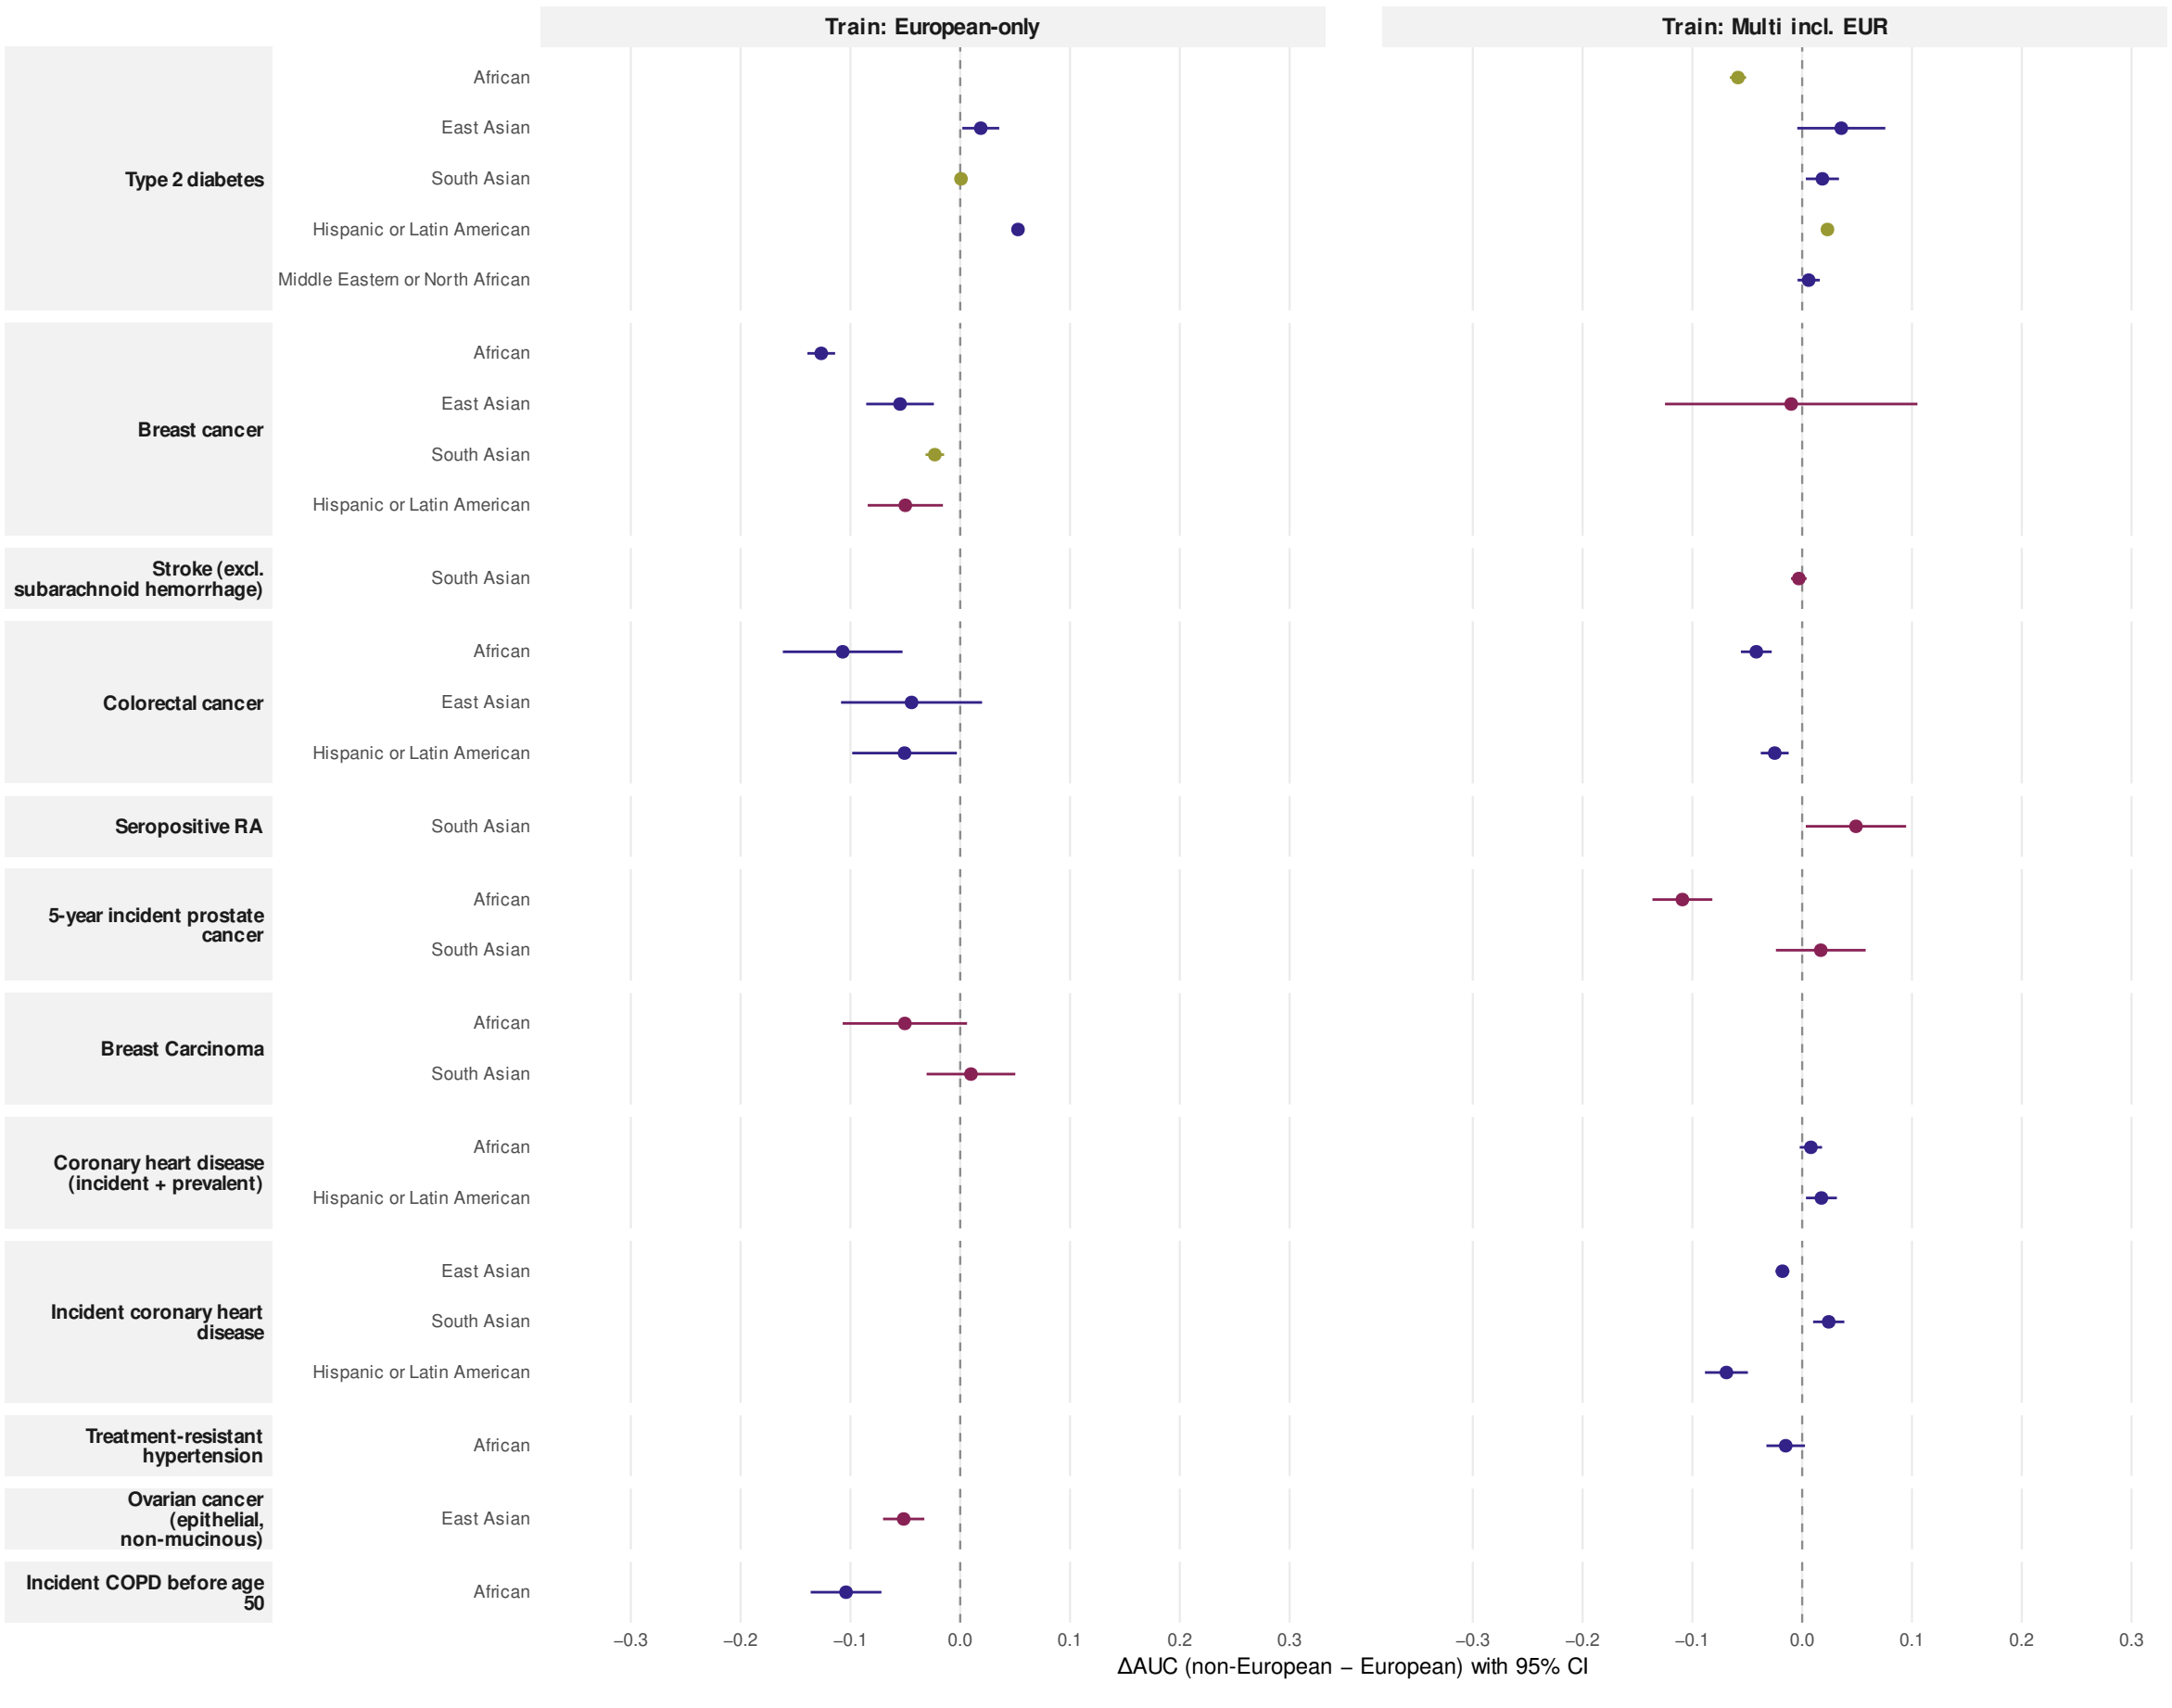
ΔAUC by covariate content of the scores in each comparison

19 comparisons use covariates on every score. 9 use none. 4 include both kinds of score. Every delta is one covariate class on the European side and on the non-European side. The accompanying figure shows each score in the comparisons that include both kinds.



Each point is the average of all scores in the comparison. Colour is the covariate class of those scores: covariates on every score, no covariates on any score, or both kinds of score. A class present on one side only is not part of a delta. When one score has more than one class on both sides, the score-only delta is kept, then age, sex, and principal components, then clinical covariates. Age, sex, and principal components count as covariates.
