

ΔAUC restricted to pairs with the same covariate class on both sides

95 of 107 pairs match. Matched estimate shown only where that drops pairs: 2 cells. 2 cells have no matched pair. 0 inference changes.

IVW fixed effect: inverse-variance pool of every pair in the cell. Covariate-matched pairs: the same pool after keeping pairs whose two sides share one covariate class, drawn only when that removes at least one pair. Class from the Catalog 'Covariates Included in the Model' field: None (PRS only) / Age-sex-PCs-technical / Clinical or other. k is the number of pairs in that point. * = 95% CI excludes zero.
