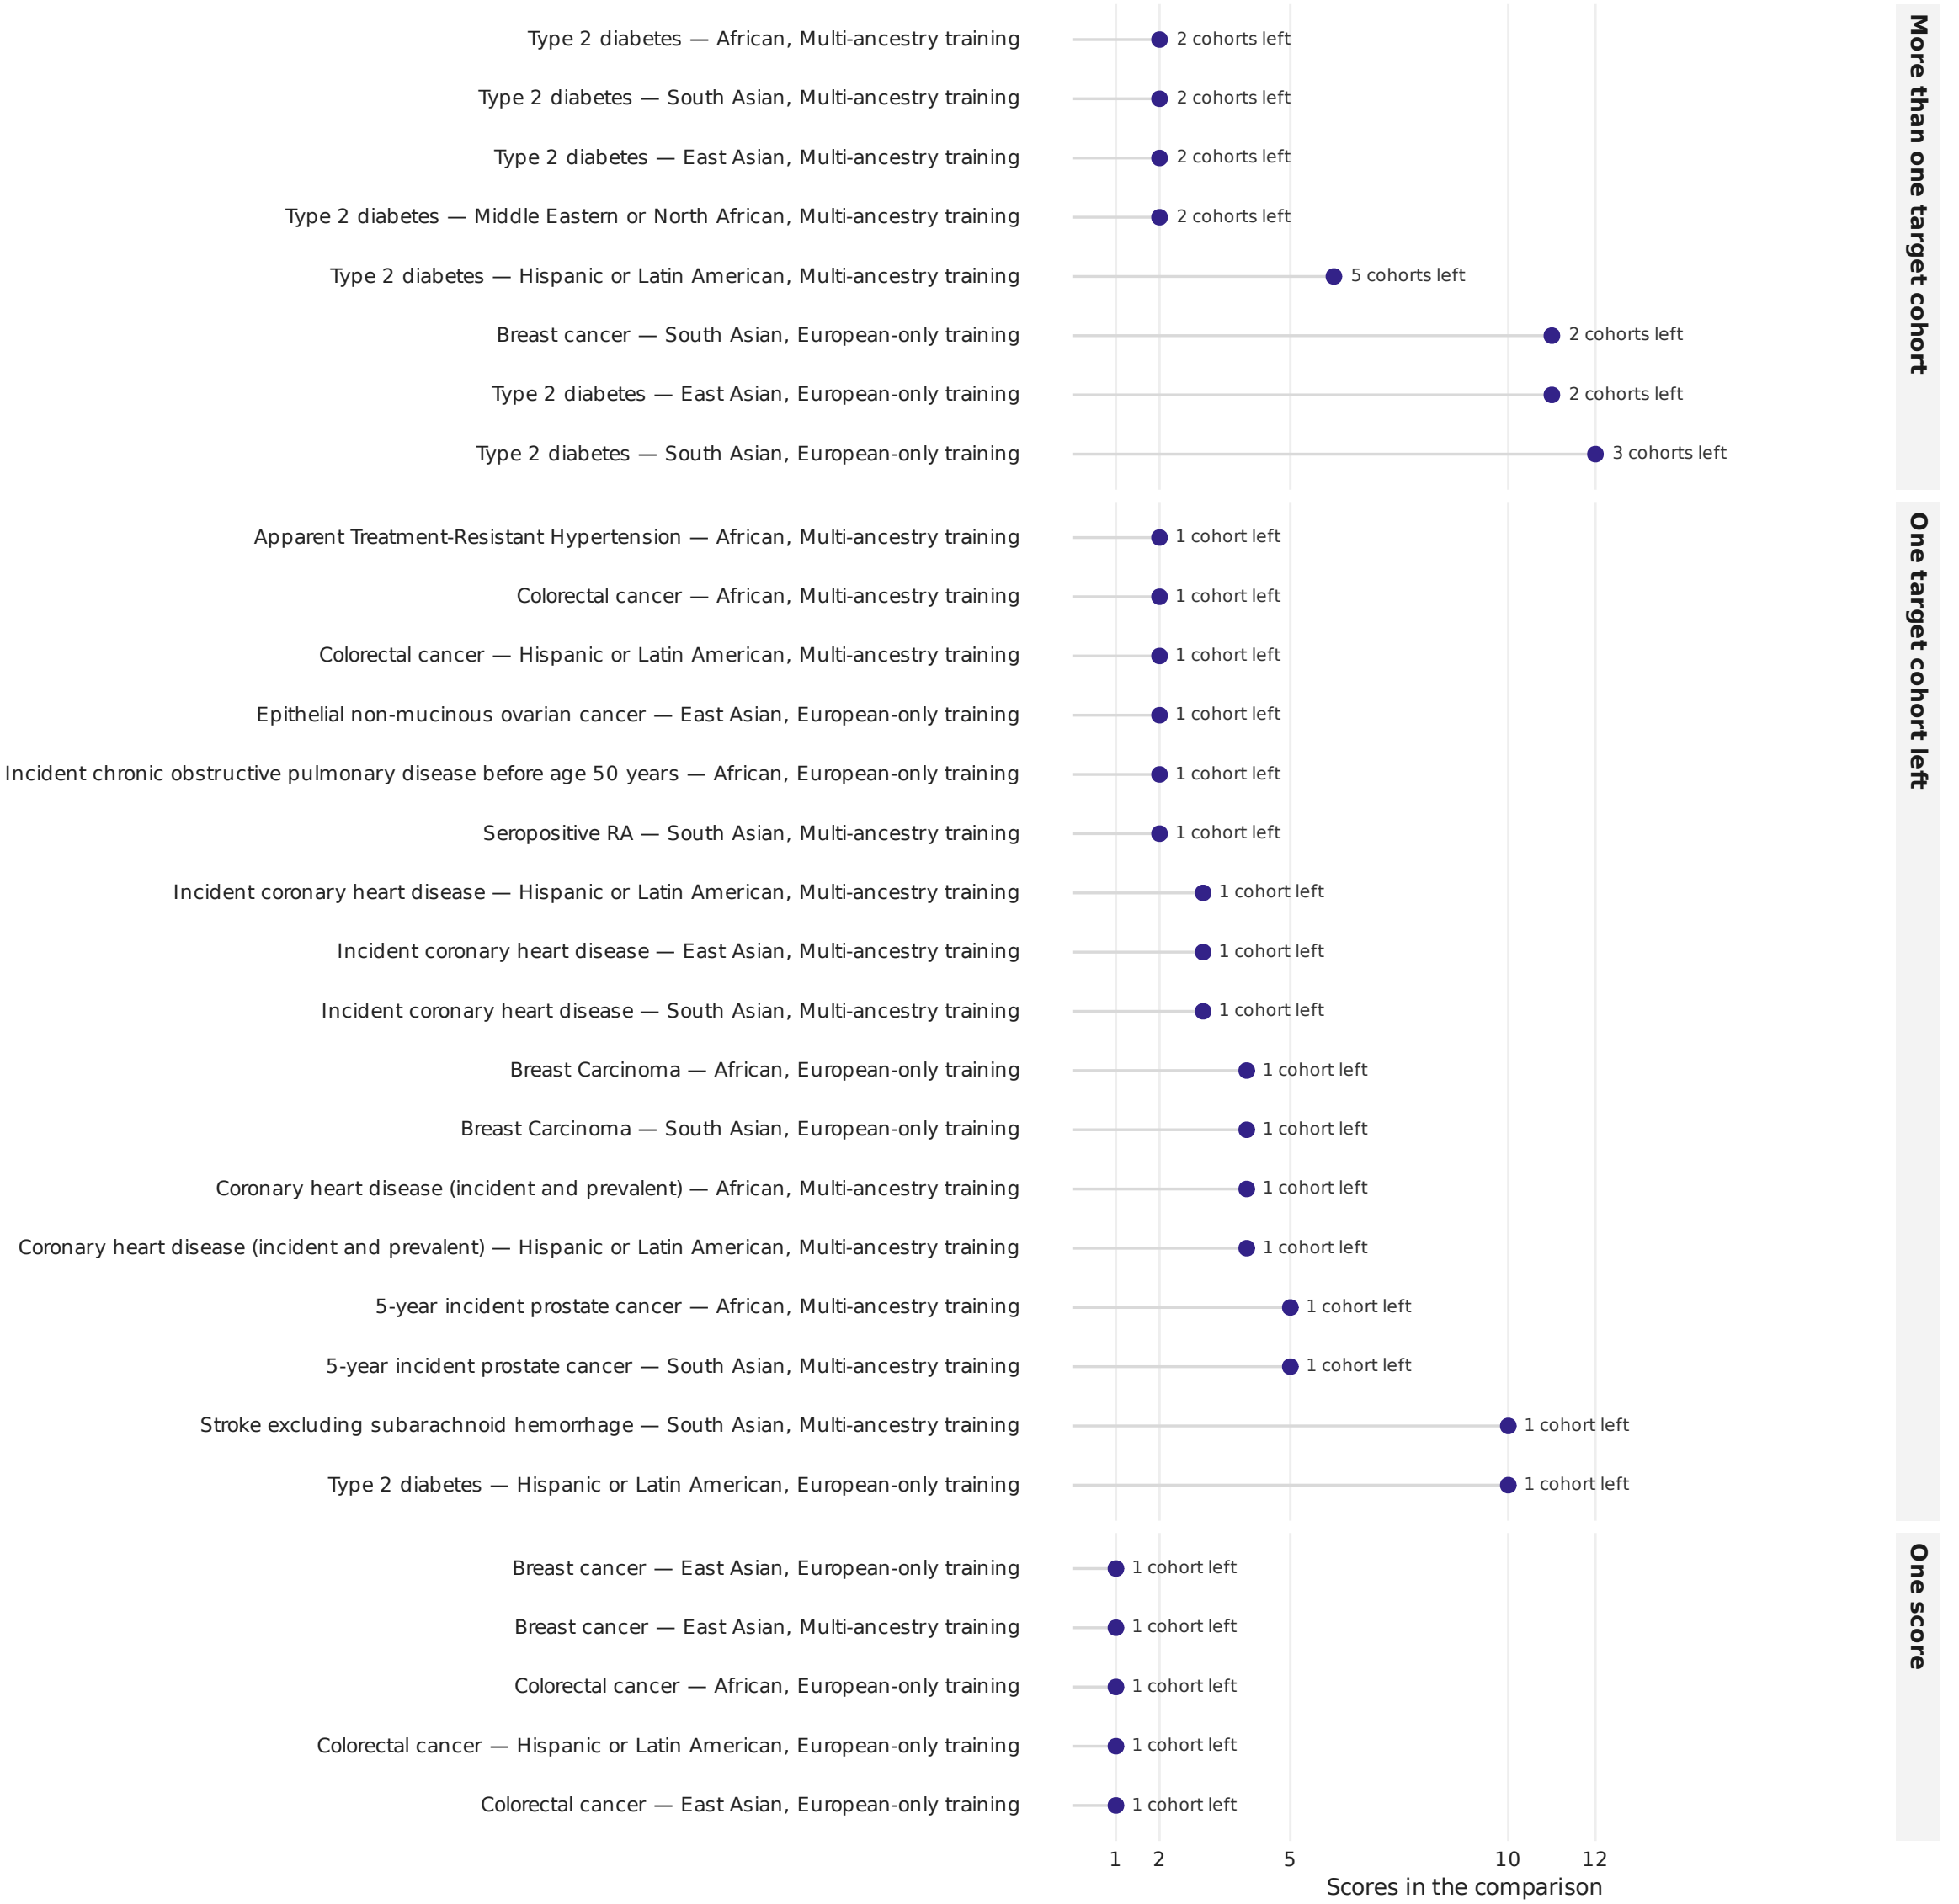
1. Thirty comparisons. The cohort model can be fit in eight of them.

Each row is one trait, one training bucket, and one target ancestry.
A cohort term needs more than one target cohort. That is the top panel. The middle panel is the same sharing with one target cohort left.



Catalog stamp 20260923, after one evaluation per score, sample set, and ancestry.
Stroke is in the middle panel: ten scores sit on two South Asian sample sets, and one score per set of cohorts leaves a single ancestry difference.
The bottom panel has one score. Nothing is shared, so neither check applies.
