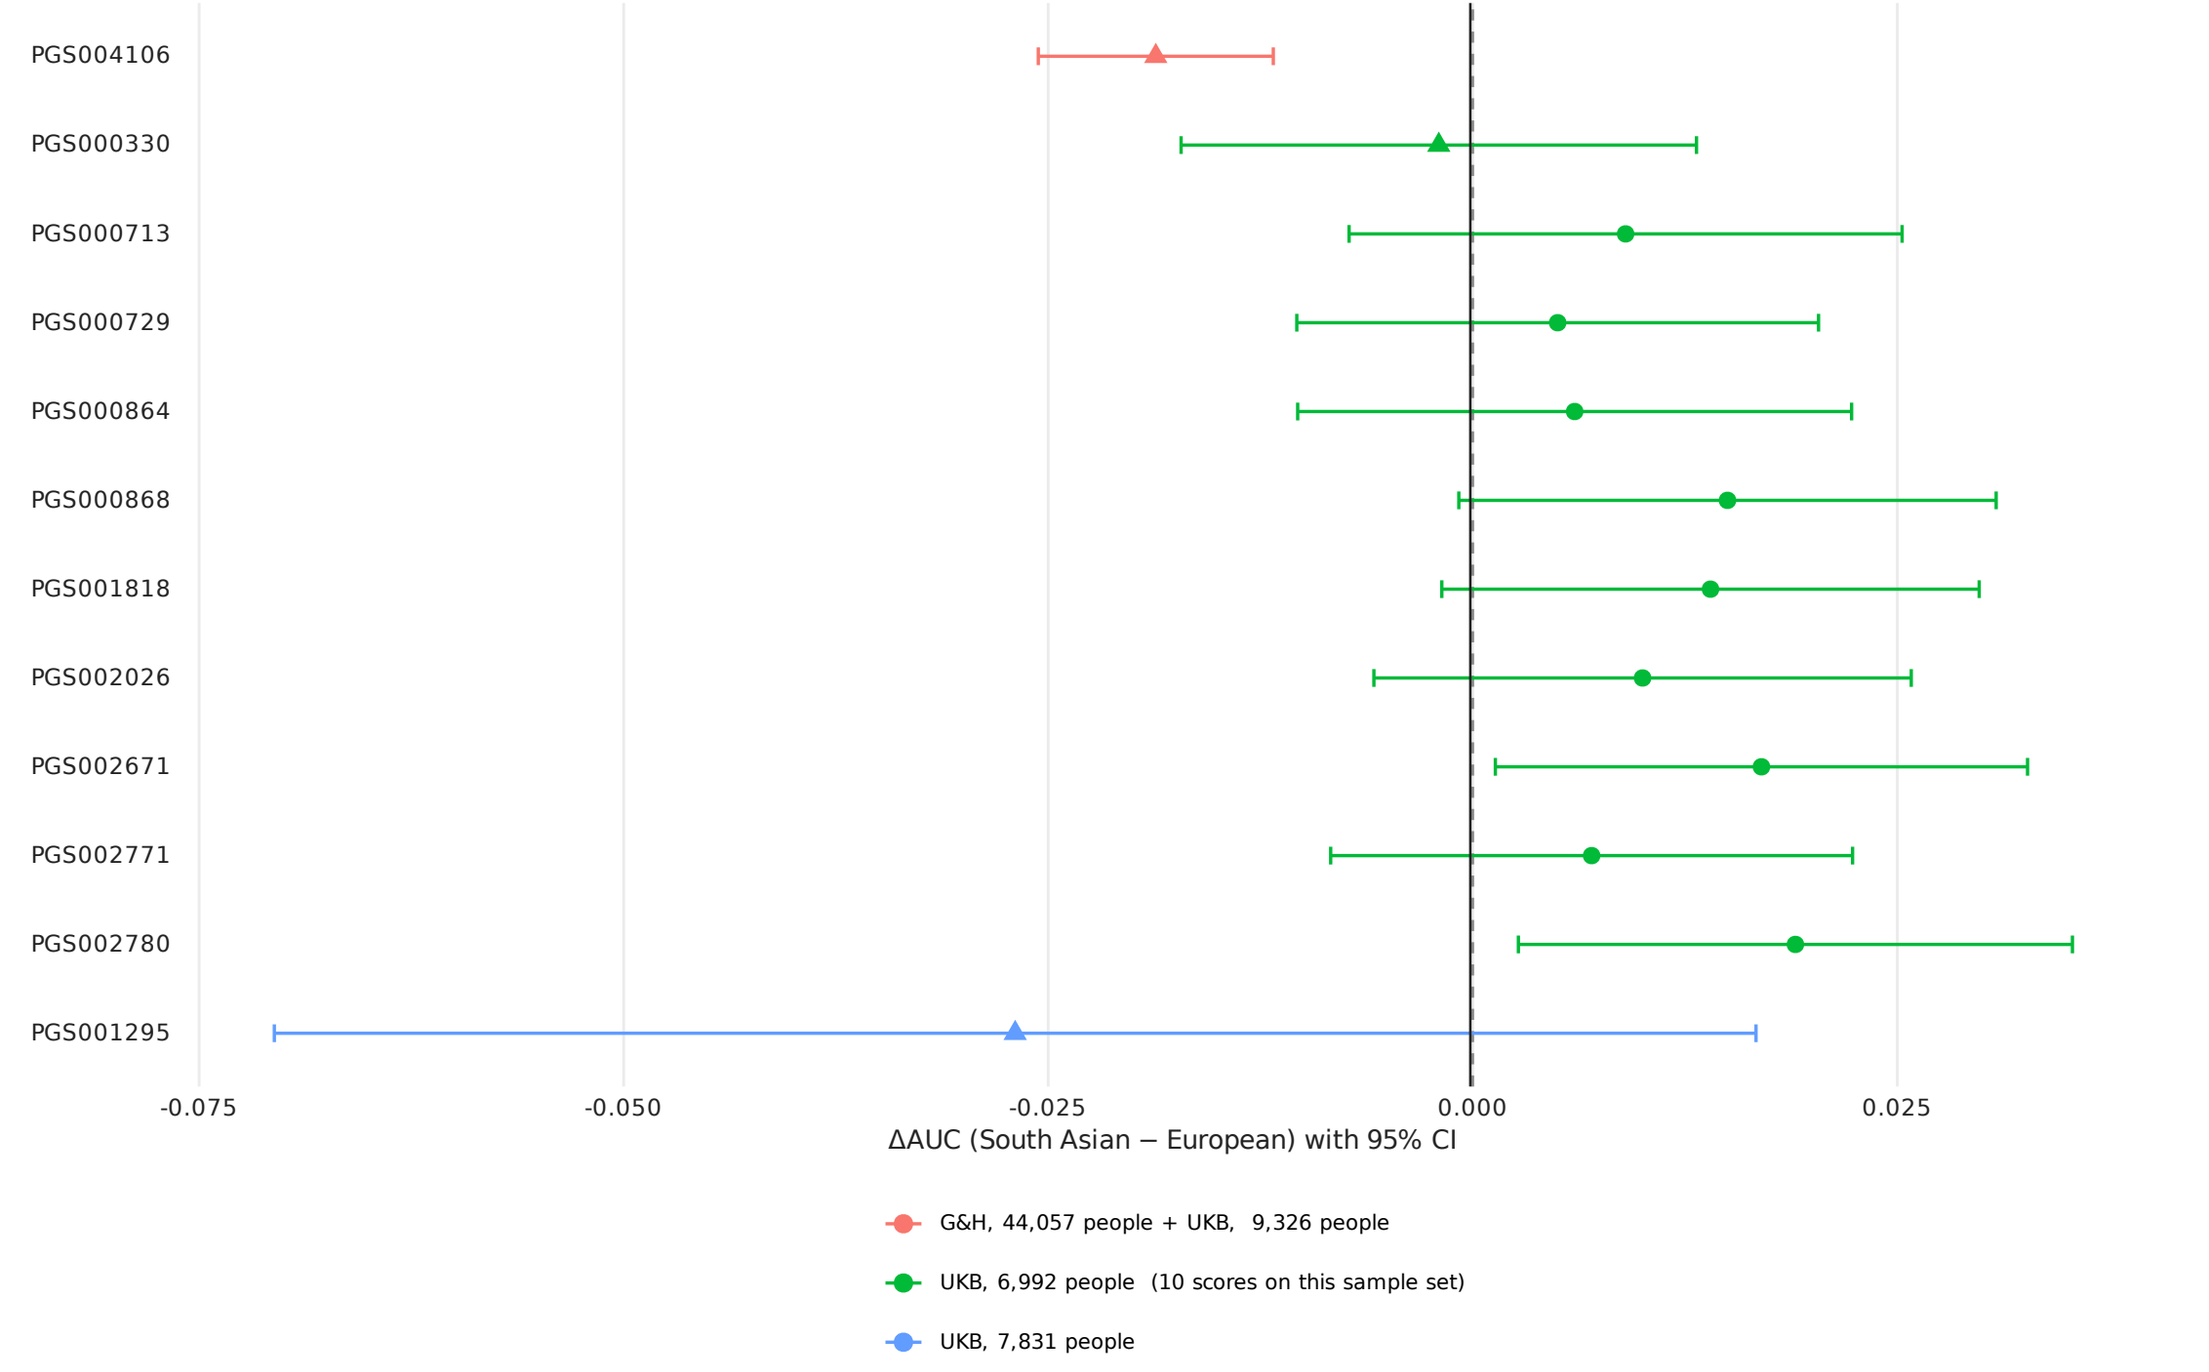
2. One of the eight. Ten scores share PSS011749, and other target cohorts remain.

Type 2 diabetes, South Asian target, European-only training.

Triangles are the score kept for each target cohort. Circles are further scores on a cohort that already has a triangle. The black line is the inverse-variance pool of all twelve



The pool of twelve is -0.0001 (-0.0042 to 0.0039) and includes 0. One score per target cohort leaves three values. Their pool is -0.016 (-0.022 to -0.010) and excludes 0.

On the page for Georg, lmer(AUC ~ ancestry + PGS + (1|cohort)) gives -0.011 for South Asian in this training bucket (-0.025 to 0.004).

That number is an ancestry coefficient from the joint model. It is not a point on this ΔAUC axis. The interval includes 0.
