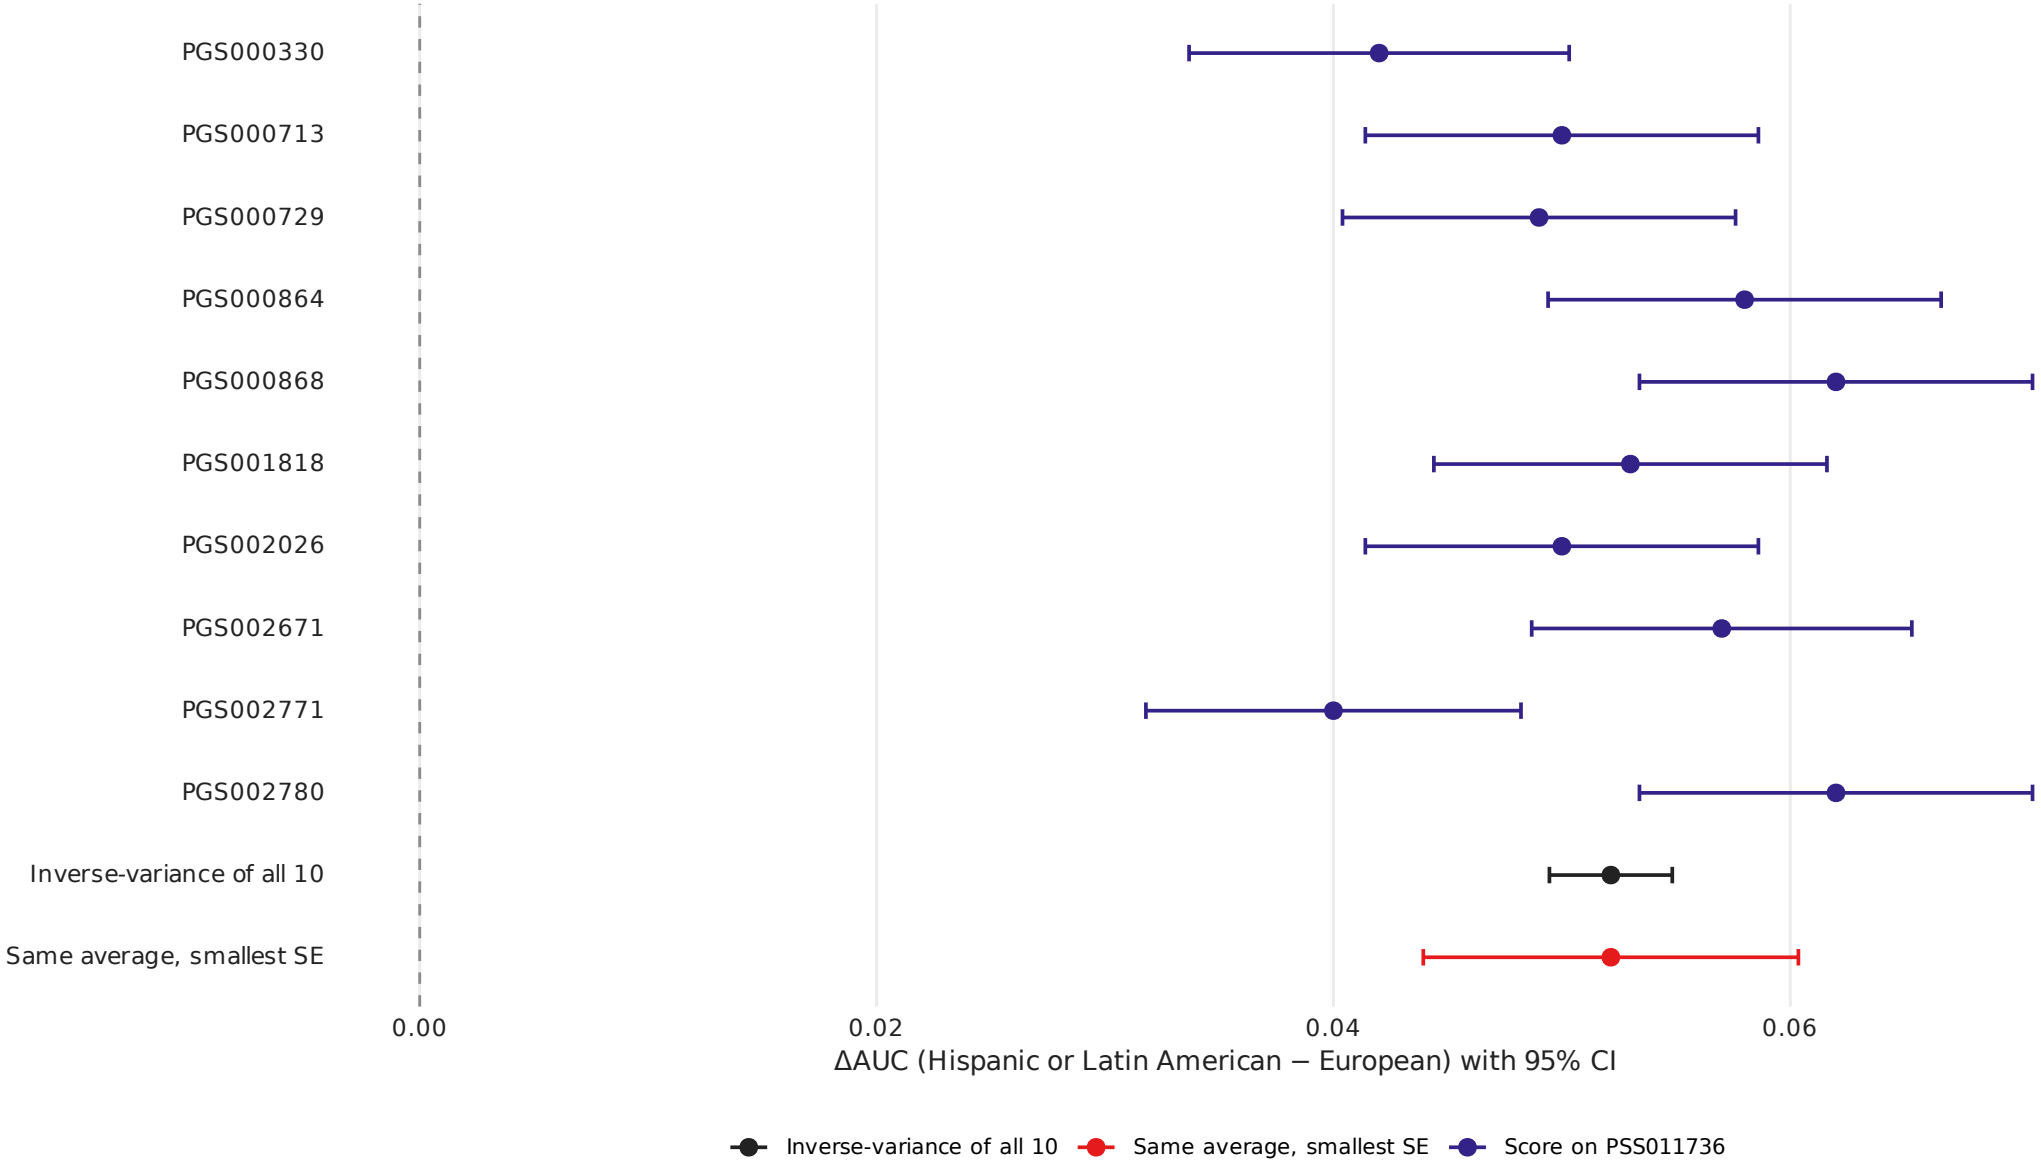
3. One of the seventeen. Ten scores, and the only target cohort is PSS011736.

Type 2 diabetes, Hispanic or Latin American target, European-only training.
The rows that are Hispanic are the rows that are this sample set. A cohort term and the ancestry term are the same column.



The black interval is the inverse-variance pool, 0.052 (0.049 to 0.055). It counts the same people ten times, so it is too narrow.
The red interval keeps that average and uses the smallest standard error, 0.0042. It runs from 0.044 to 0.060 and still excludes 0.
This comparison does not change its call. Three of the seventeen do. They are marked on the next plot.
