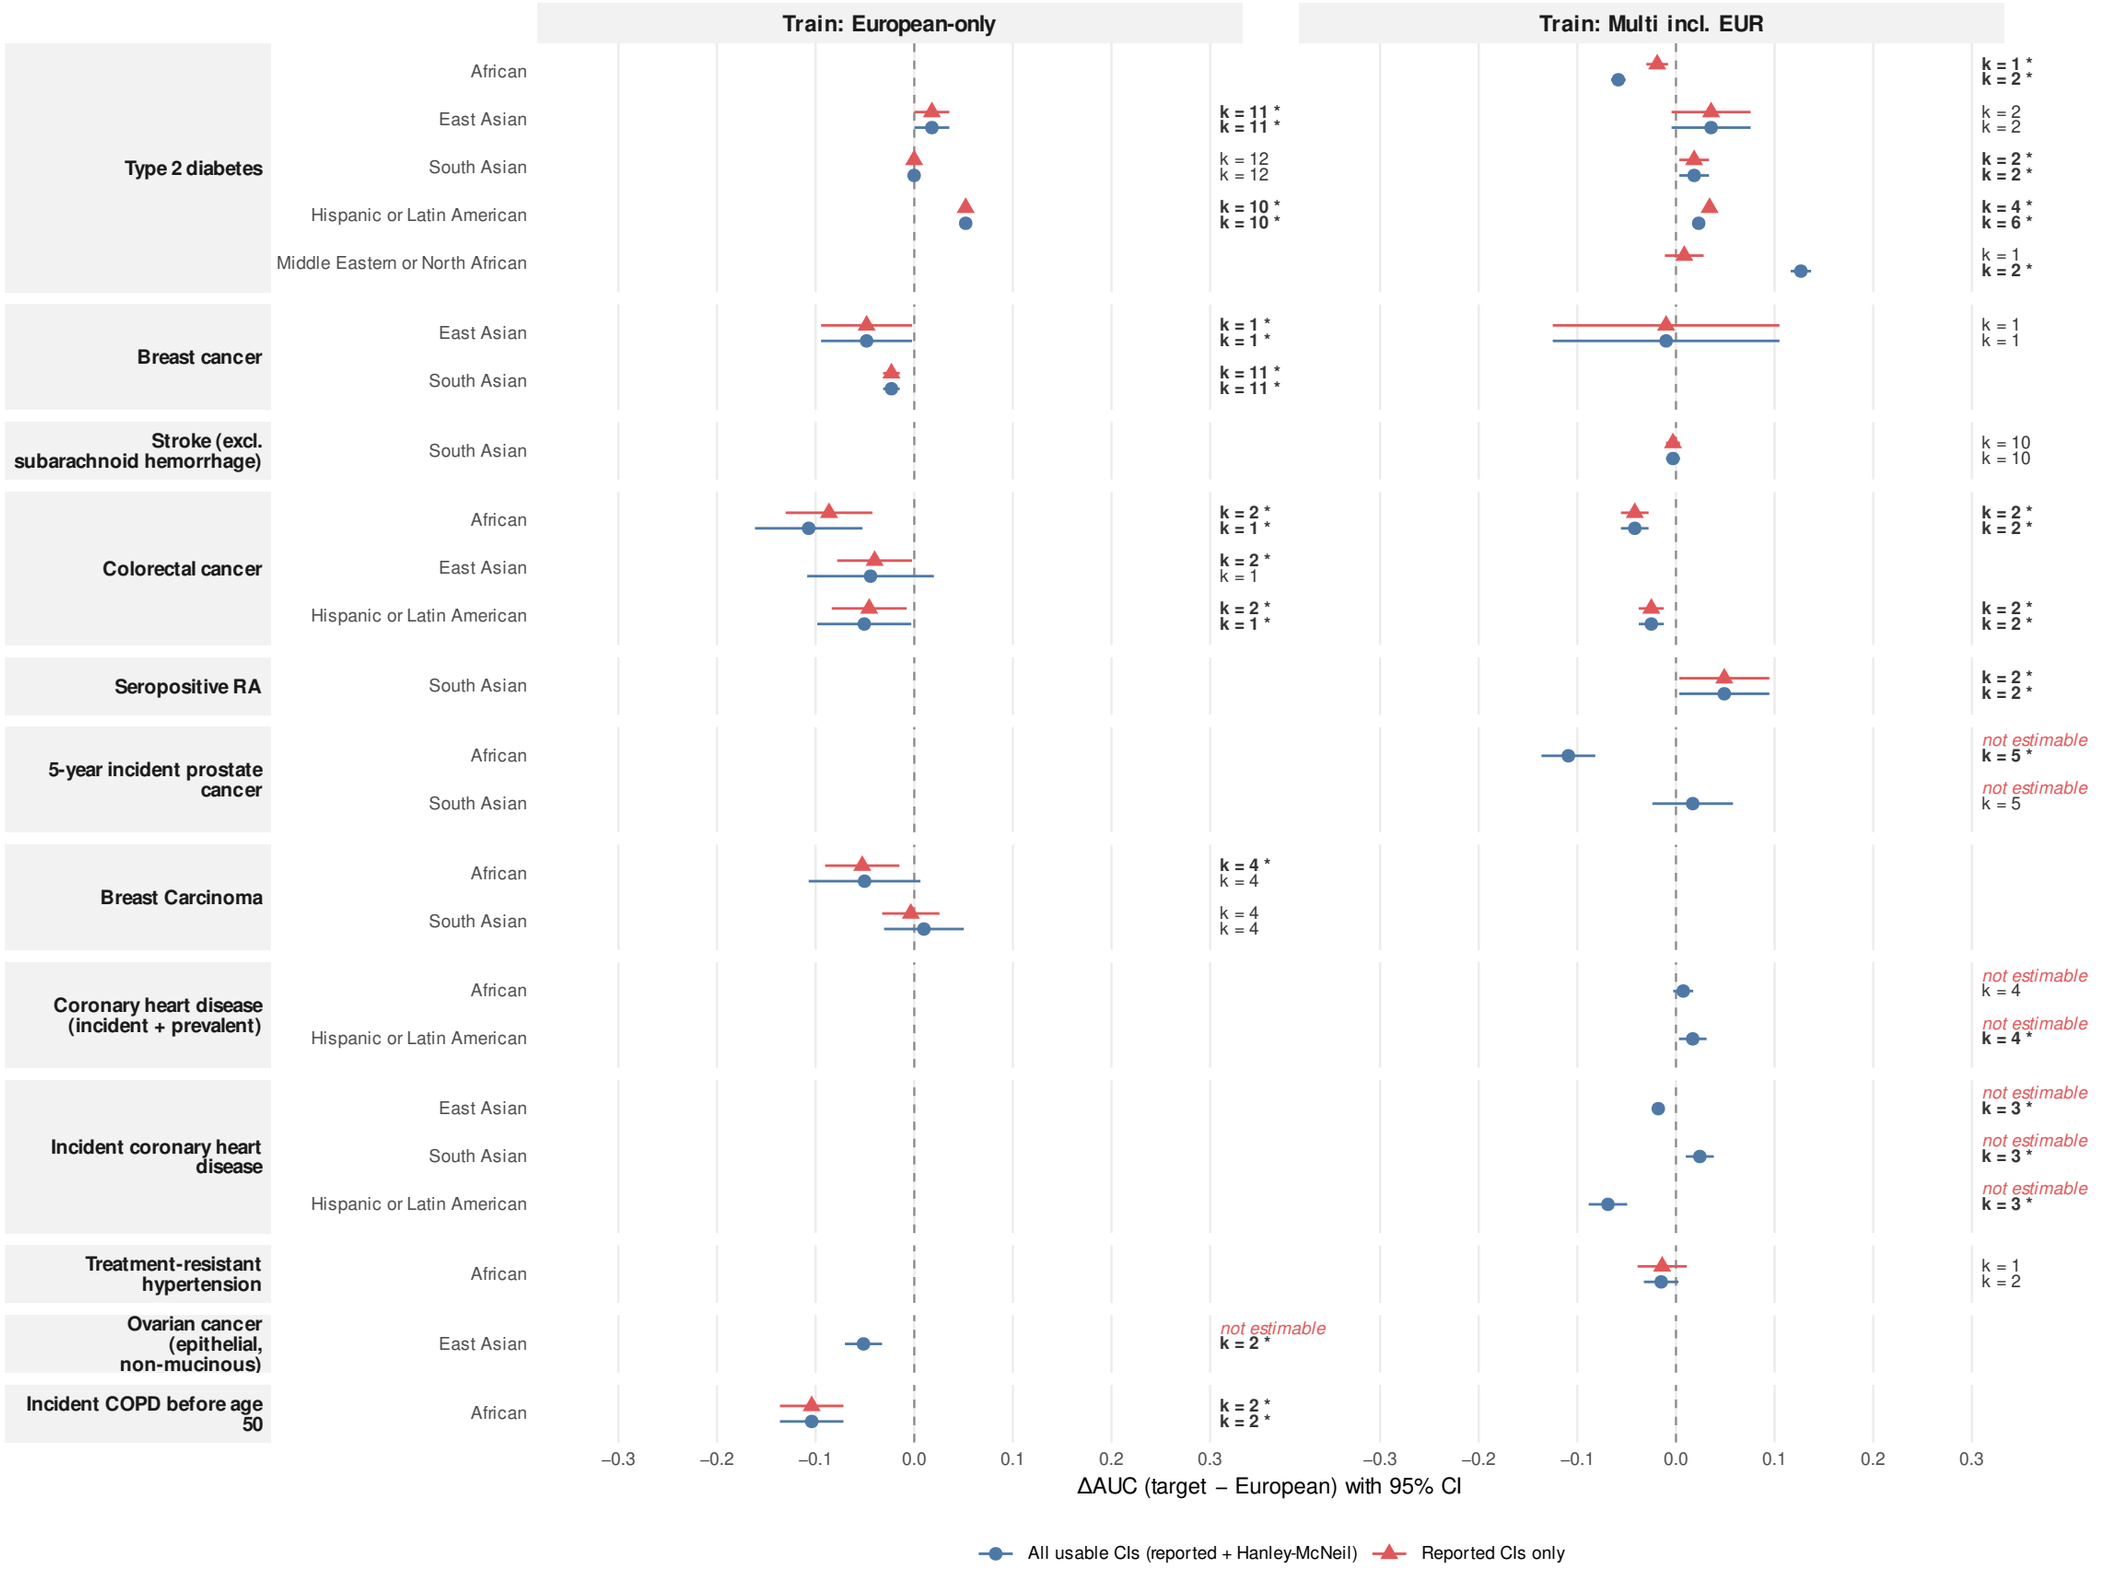
Sensitivity: ΔAUC with vs without Hanley-McNeil recovered CIs (delta-method SE)

22 of 30 cells remain estimable with reported CIs only; 1 sign flips; 3 changes in whether the 95% CI excludes zero.



k = number of PGS with a paired European/target estimate; * = 95% CI excludes zero.
'not estimable' = every PGS in the cell depended on a Hanley-McNeil recovered CI.
