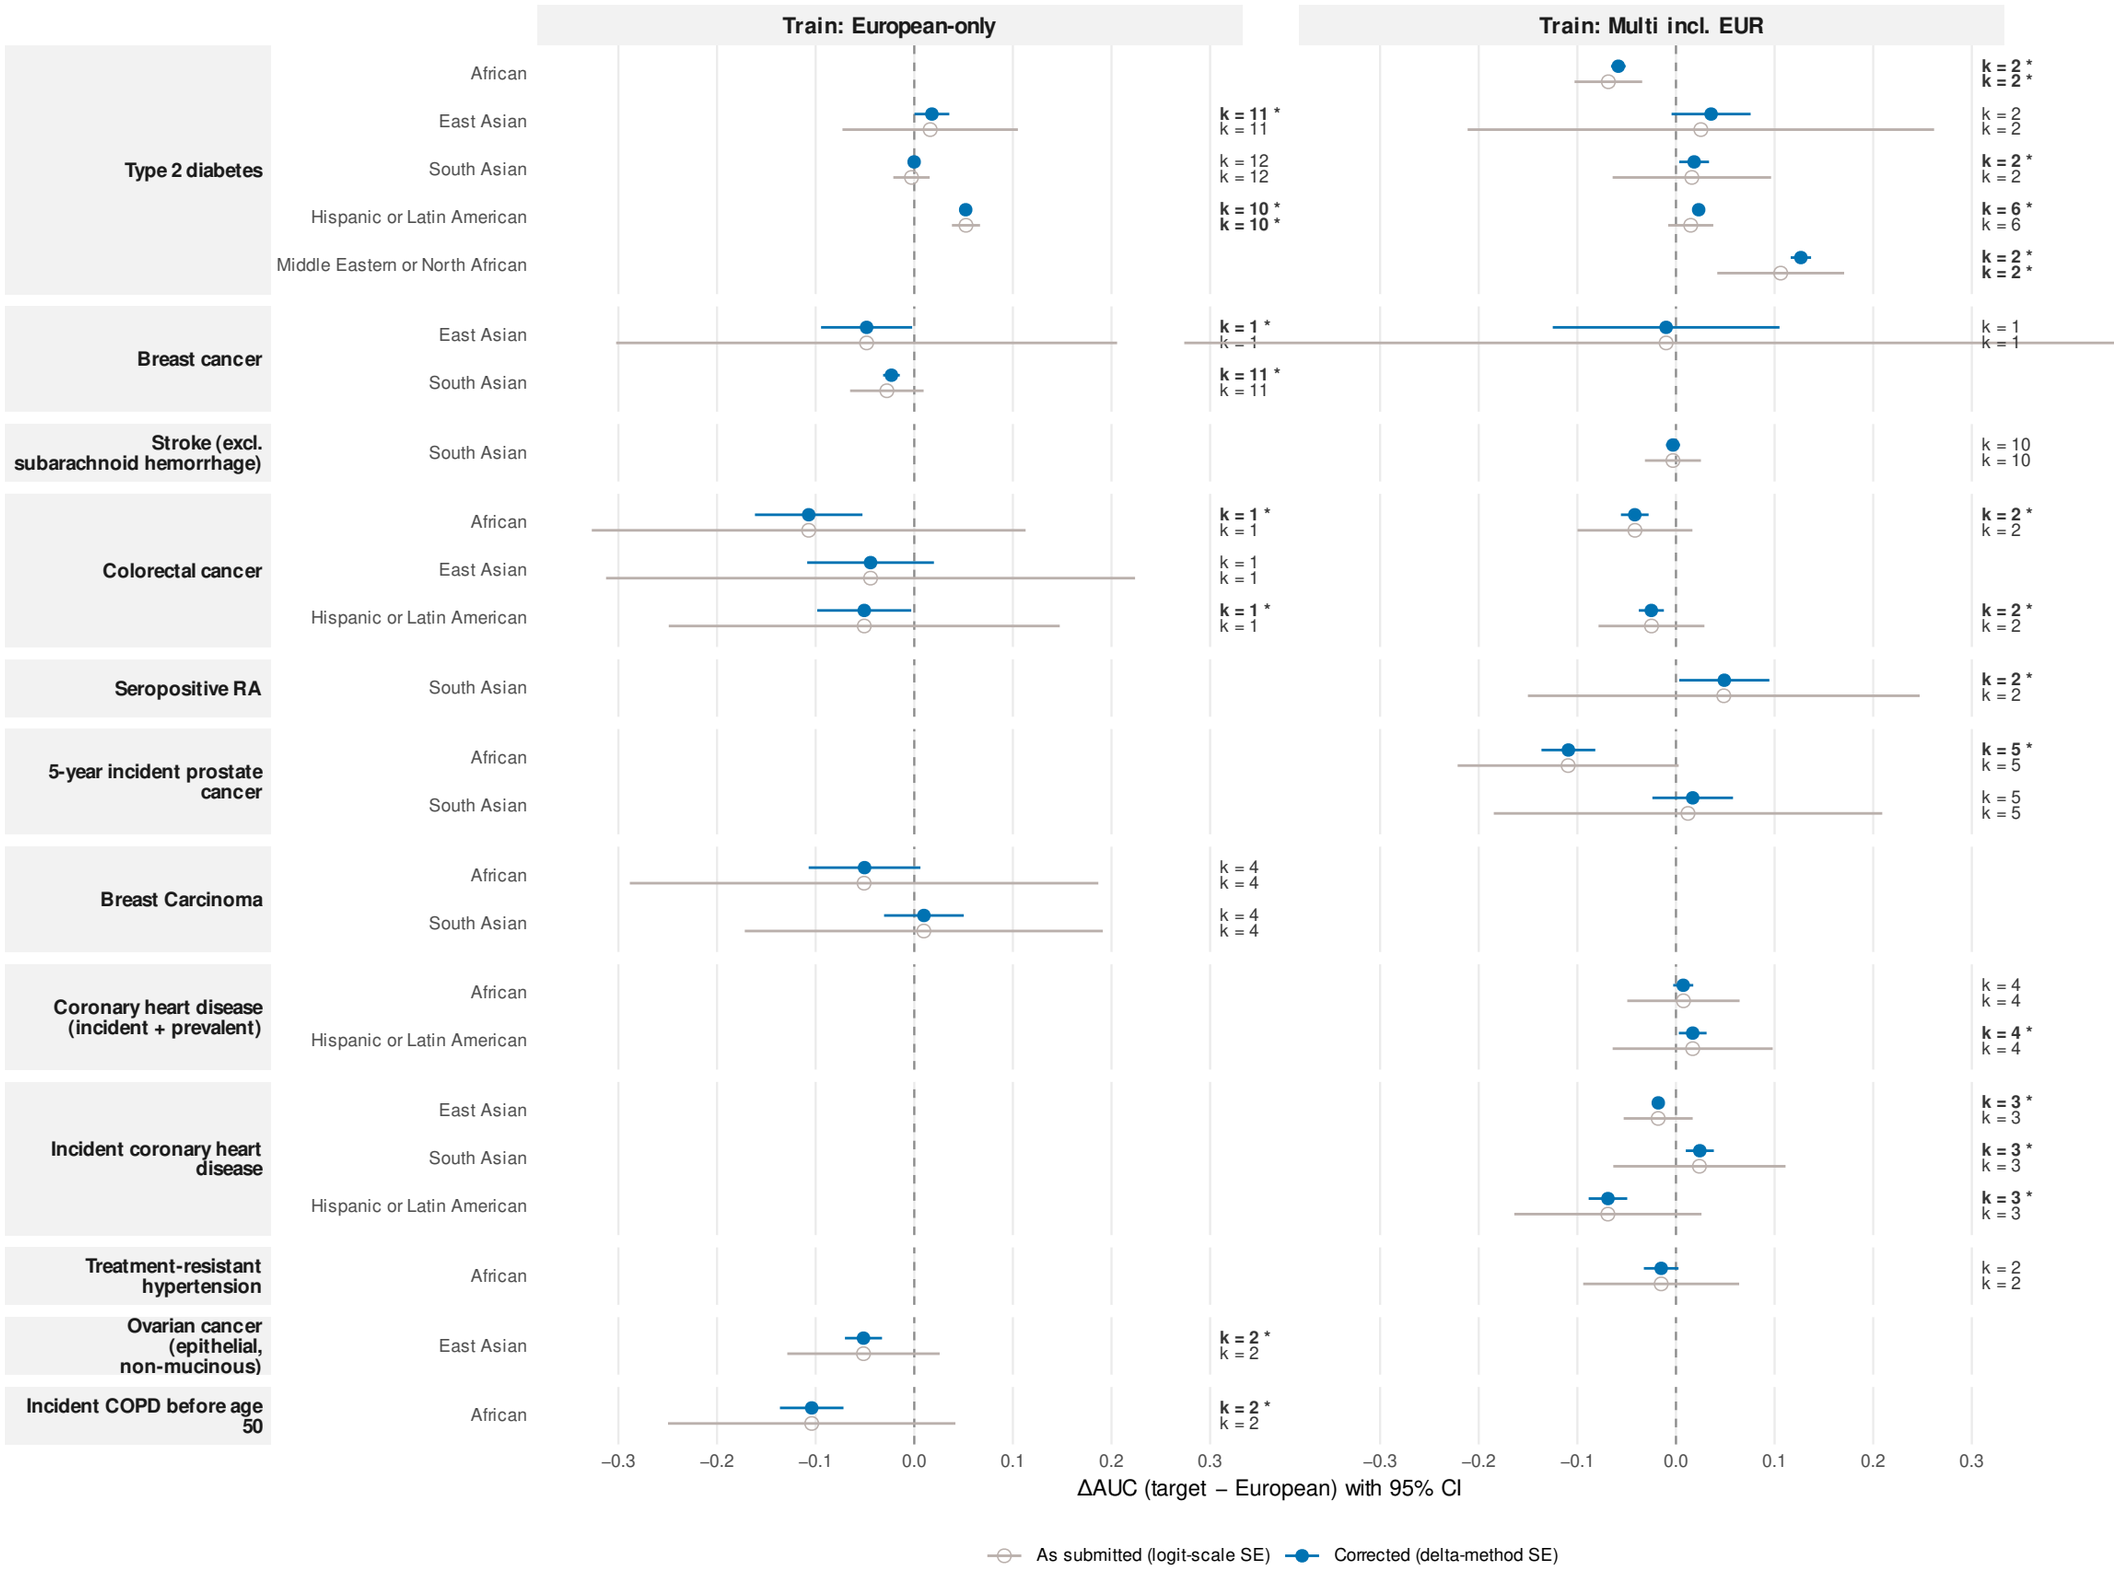
Figure 1C before and after putting Stage-2 standard errors on the AUC scale

Cells with 95% CI excluding zero: 3 as submitted -> 20 corrected (12 deficits, 8 advantages). SE inflation as submitted: 4-6.2x.



Point estimates differ by at most 0.02 (weights change with the SE). k = number of PGS per cell; * = 95% CI excludes zero (bold label refers to the corrected version).
Corrected SE_AUC = SE_logit x AUC(1-AUC); identical inference when SE is derived from the back-transformed CI (0 disagreements).
