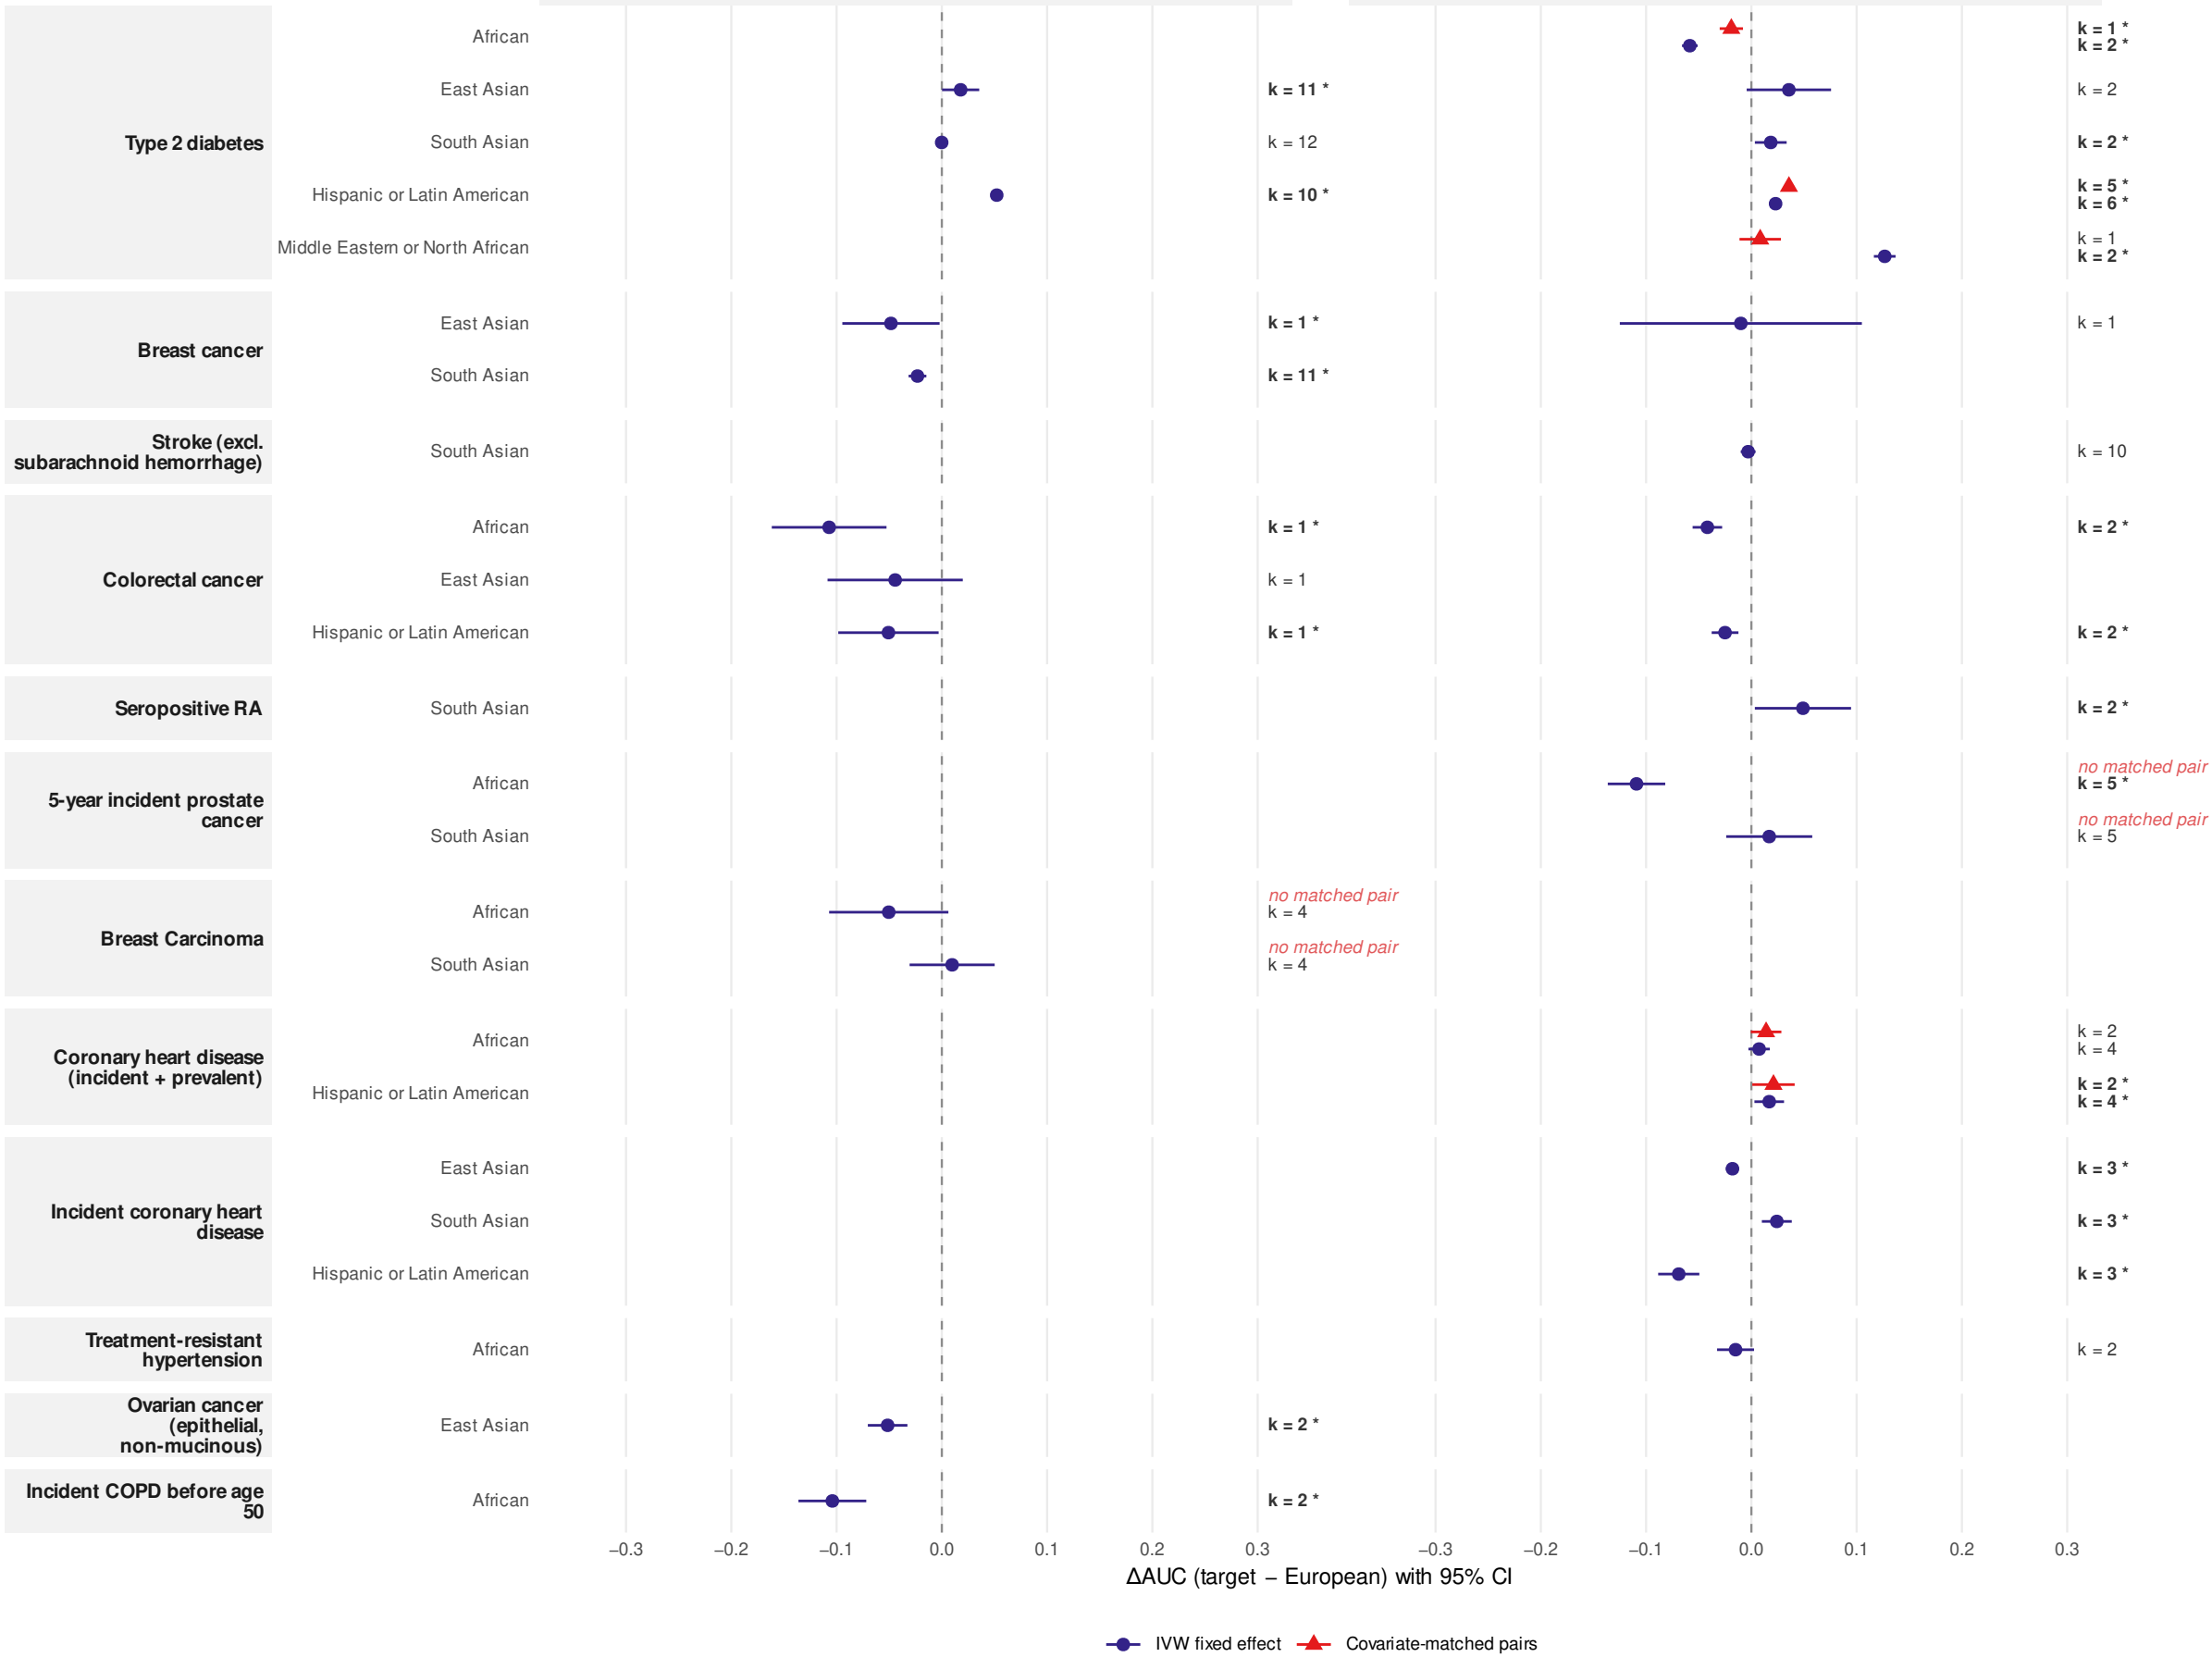
ΔAUC restricted to pairs with the same covariate class on both sides

95 of 120 pairs match. Matched estimate shown only where that drops pairs: 5 cells. 4 cells have no matched pair. 1 inference changes.



IVW fixed effect: inverse-variance pool of every pair in the cell. Covariate-matched pairs: the same pool after keeping pairs whose two sides share one covariate class, drawn only when that removes at least o
Class from the Catalog 'Covariates Included in the Model' field: None (PRS only) / Age-sex-PCs-technical / Clinical or other. k is the number of pairs in that point. * = 95% CI excludes zero.
