

2. Dropping the mixed-class scores moves the pooled ΔAUC

Indigo pairs are kept. Grey pairs leave. The black diamond is the inverse-variance pool of all four. The red triangle is the pool of the two kept scores. That is the only second point the review figure draws for these cells.

The four standard errors within a cell are almost the same, so the pool is close to a simple mean.
African: the two dropped scores sit near 0, and the pool moves from 0.007 to 0.014. Both intervals still include 0.
Hispanic or Latin American: the pool moves from 0.017 to 0.021. Both intervals still exclude 0. Matching changes the estimate and leaves the conclusion in place.
