

3. Every other cell keeps a single point

24 of 28 cells already match on every pair, so a second pool would repeat the first number.
2 cells, both breast carcinoma, have no matched pair. The review figure keeps the full inverse-variance point and writes "no matched pair".

Ovarian cancer: both scores are fit with no covariates on either side. The matched pool equals the full pool.
Breast carcinoma, African: each score mixes "Age/sex/PCs/technical" and "None (PRS only)" on both sides, so the matched set is empty.
The diamond is the only estimate drawn. The two coronary heart disease cells in plot 2 are the only cells with a second point.
