

# 1. Twelve South Asian ΔAUC values, and three target sample sets

Type 2 diabetes, European-only training. Triangles are the score kept for each sample set (lowest PGS ID). Circles are further scores on a sample set that already has a triangle. The black line is the inverse-variance pool of all twelve.

Ten scores share one UK Biobank South Asian sample set. Pooling all twelve counts that sample ten times. The pool of twelve is about 0 and its interval includes 0. Plots 2 and 3 use the three triangles only.
