

2. The twelve-score pool and the three-score pools answer different questions

Purple diamond: inverse-variance fixed effect of the three independent scores.
Green square: DerSimonian-Laird random effects of those same three. Both exclude 0. The black diamond, all twelve, does not.

IVW of 12: -0.000 (-0.004 to 0.004). IVW of 3: -0.016 (-0.022 to -0.010). Random effects: -0.013 (-0.027 to -0.000).
PGS004106, evaluated in Genes & Health and in UK Biobank, carries most of the fixed-effect weight among the three.
Random effects gives the other two scores a little more say. The interval widens and still excludes 0.
