

4. Ten Hispanic or Latin American scores, one target sample set: no random effect

European-only training. Every score uses AllofUs, 33,652 people.
PGS000330 is the kept score. The black line is the inverse-variance pool of all ten, which is the only pooled estimate drawn.

After one score per target sample set, a single ΔAUC remains. τ^2 is not estimated from one number.
The review figure draws the fixed effect of all ten and the single retained score. It does not draw a random-effects point.
