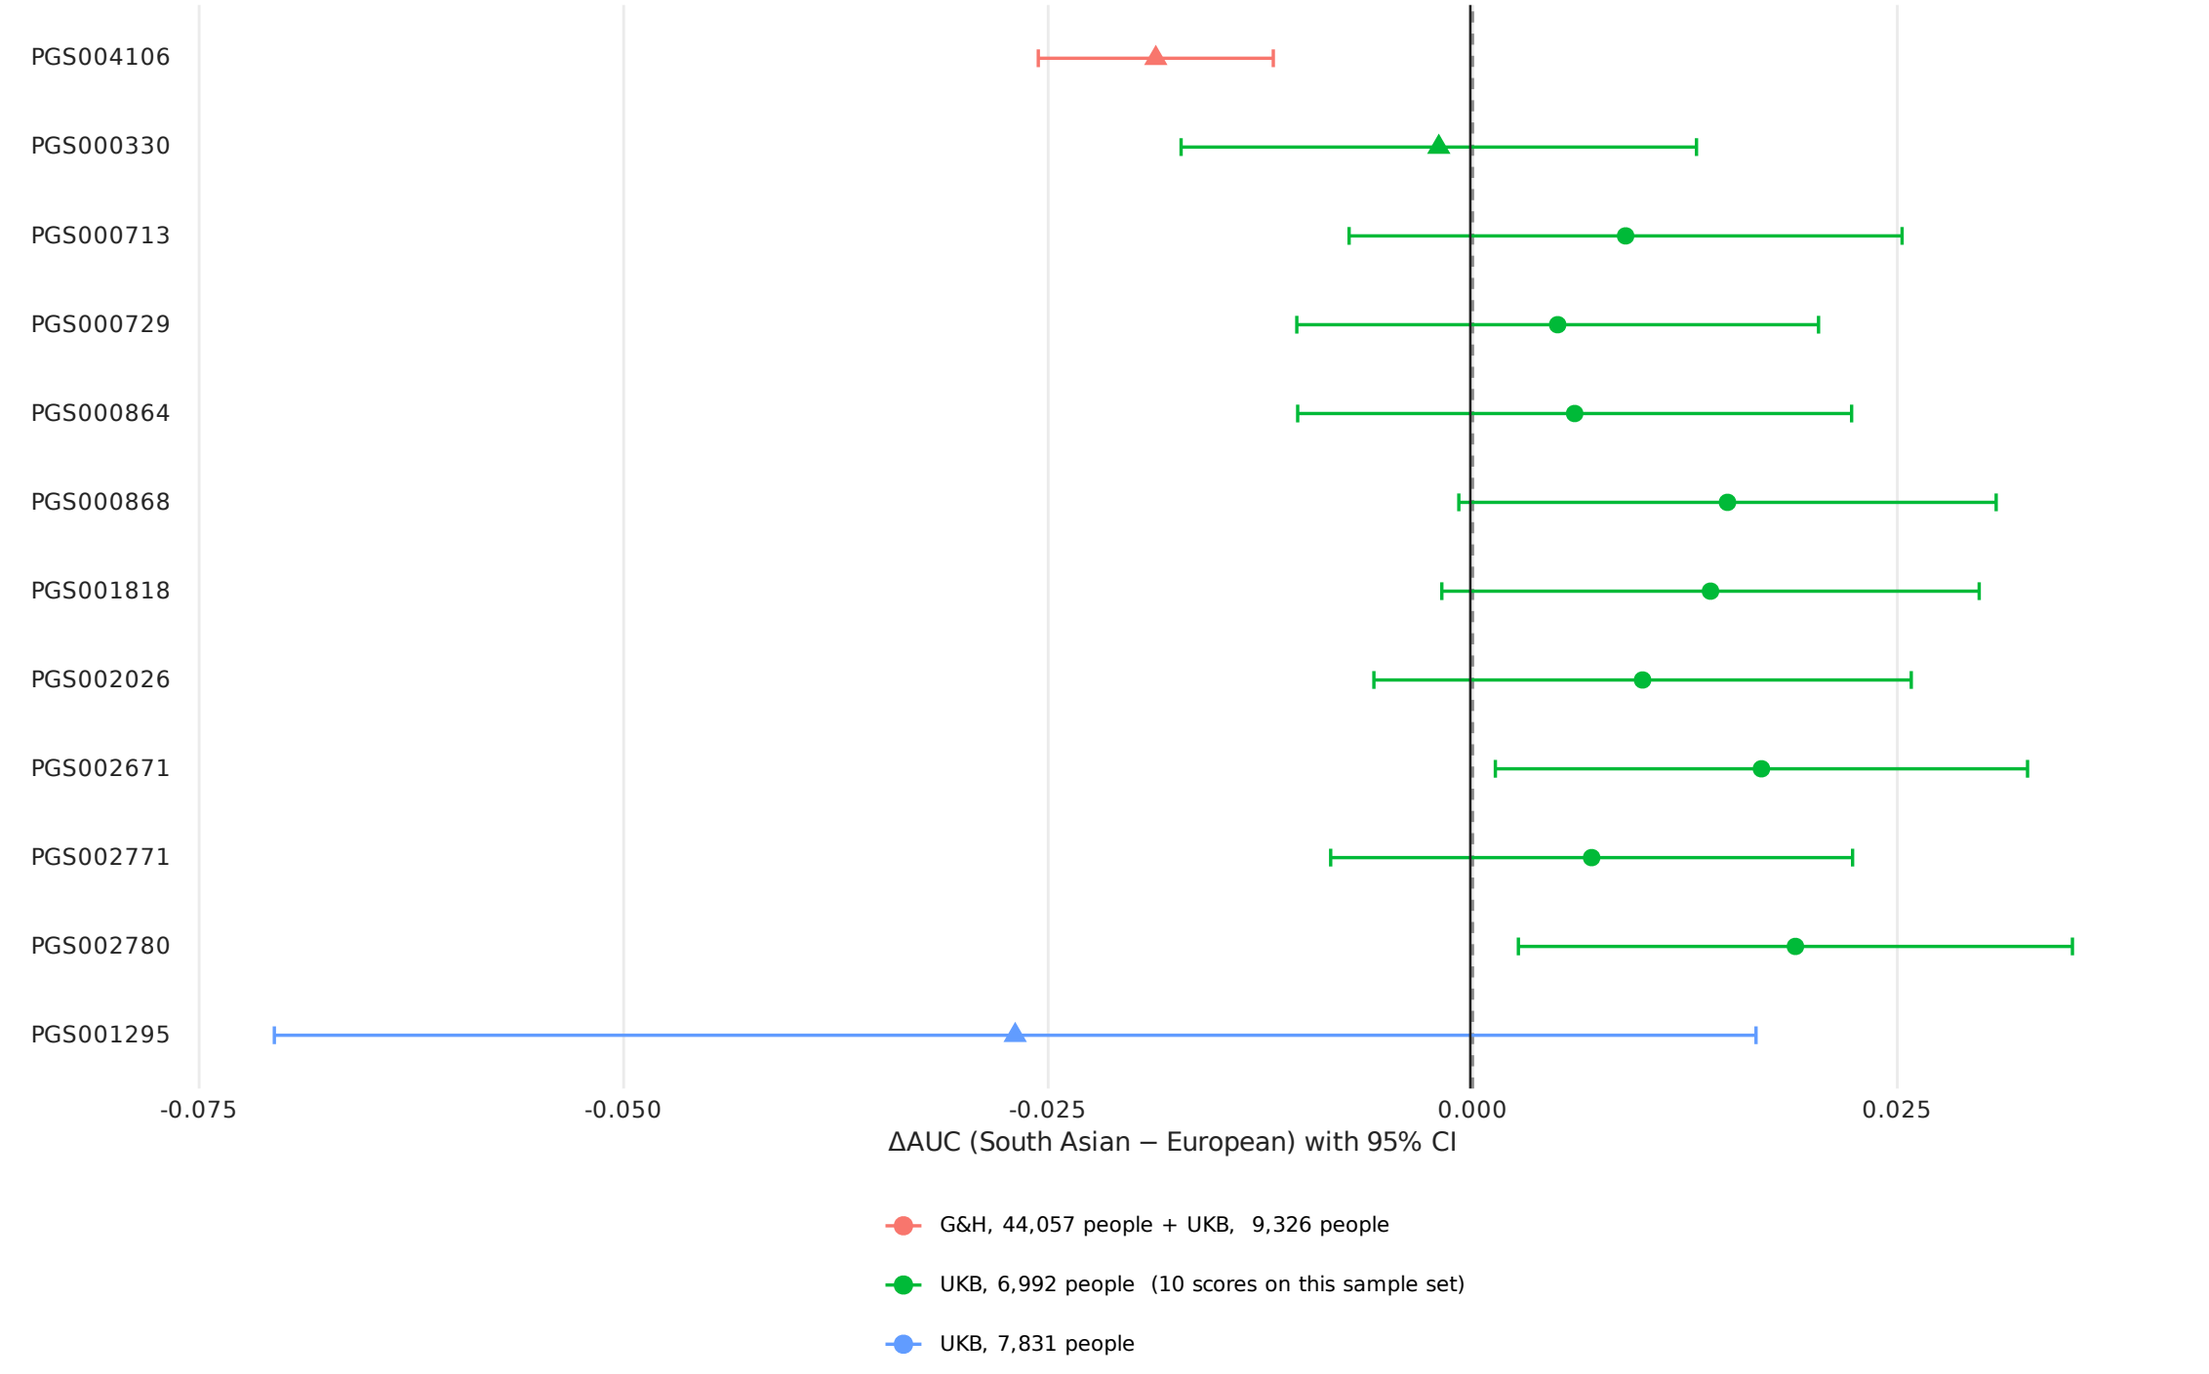
2. One of the eight. Ten PGS share PSS011749, and two other target sample sets are in the comparison.

Type 2 diabetes, Europeans and South Asian participants, European-only training.

Triangles are the PGS kept for each target sample set. Circles are further PGS on a sample set that already has a triangle. The black line is All PGS IVW, the inverse-variance



The pool of twelve is -0.0001 (-0.0042 to 0.0039) and includes 0. One PGS per target sample set leaves three values. Their pool is -0.016 (-0.022 to -0.010) and excludes 0.

On the page for Georg, lmer(AUC ~ ancestry + PGS + (1|cohort)) gives -0.011 for South Asian participants in this training set (-0.025 to 0.004). Here cohort means the sample set.

That number is an ancestry coefficient from the joint model. It is not a point on this axis. The interval includes 0.
