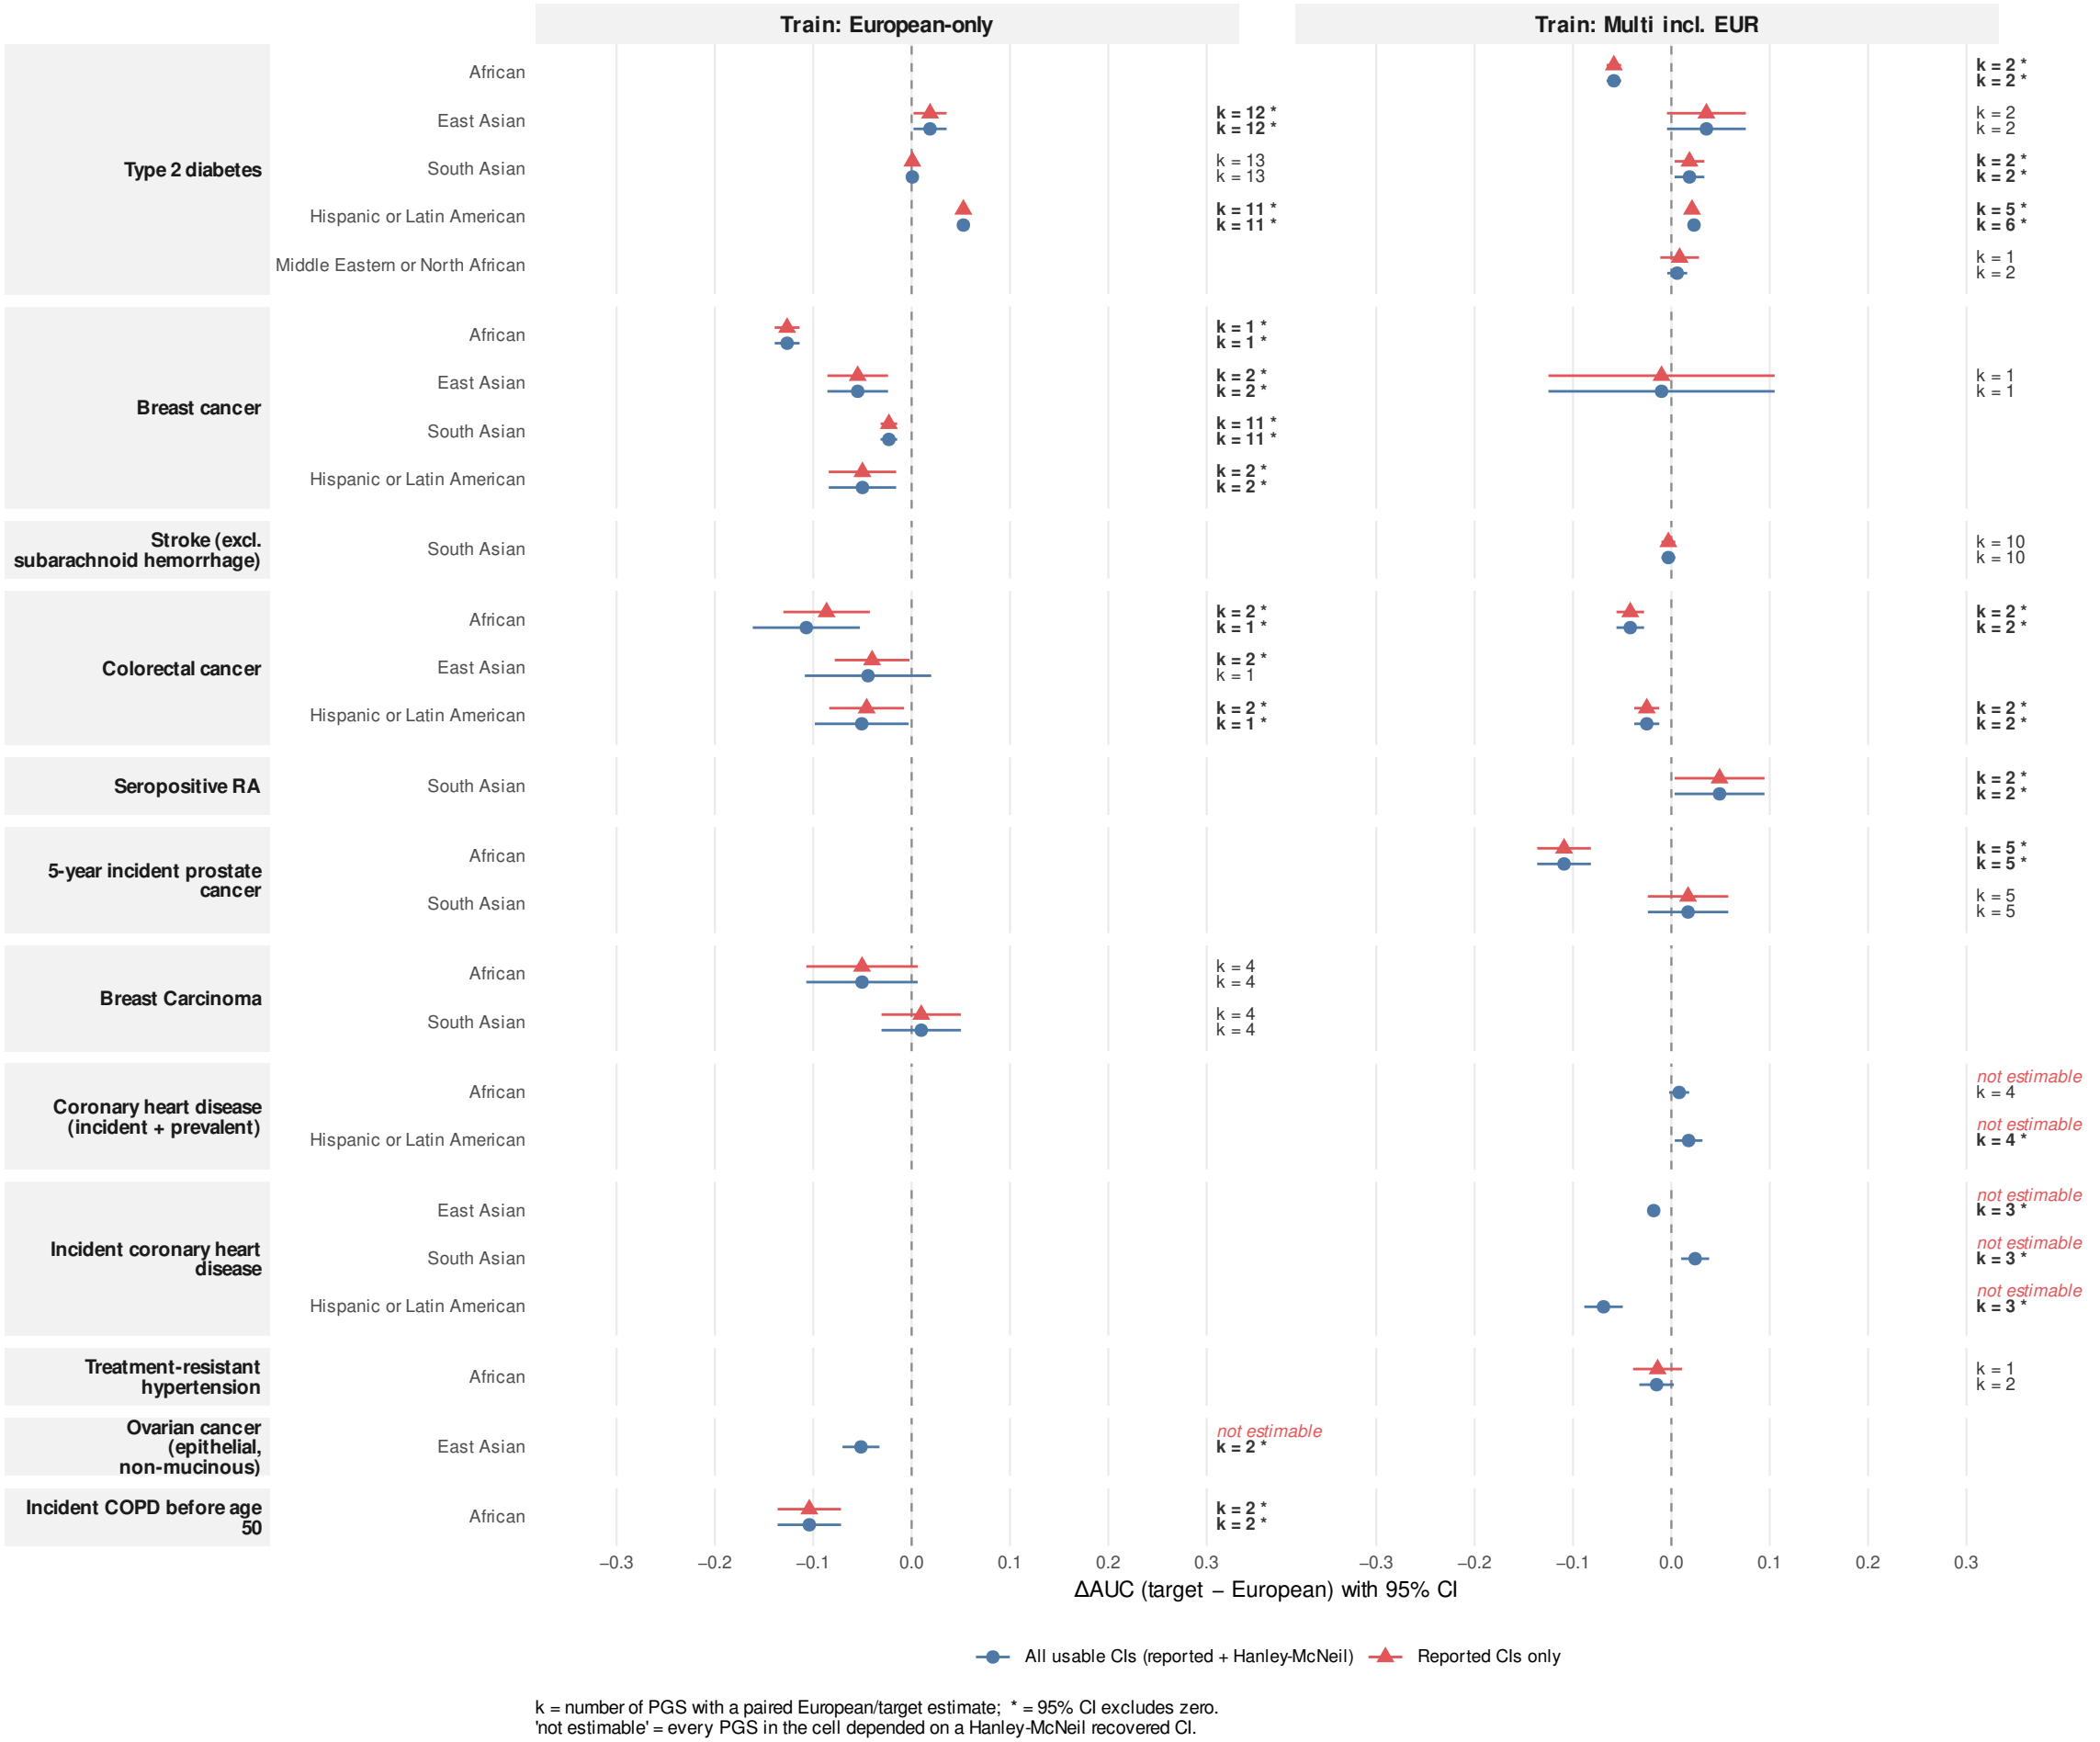
Sensitivity: ΔAUC with vs without Hanley-McNeil recovered CIs (delta-method SE)

26 of 32 cells remain estimable with reported CIs only; 0 sign flips; 1 changes in whether the 95% CI excludes zero.



k = number of PGS with a paired European/target estimate; * = 95% CI excludes zero.
'not estimable' = every PGS in the cell depended on a Hanley-McNeil recovered CI.
