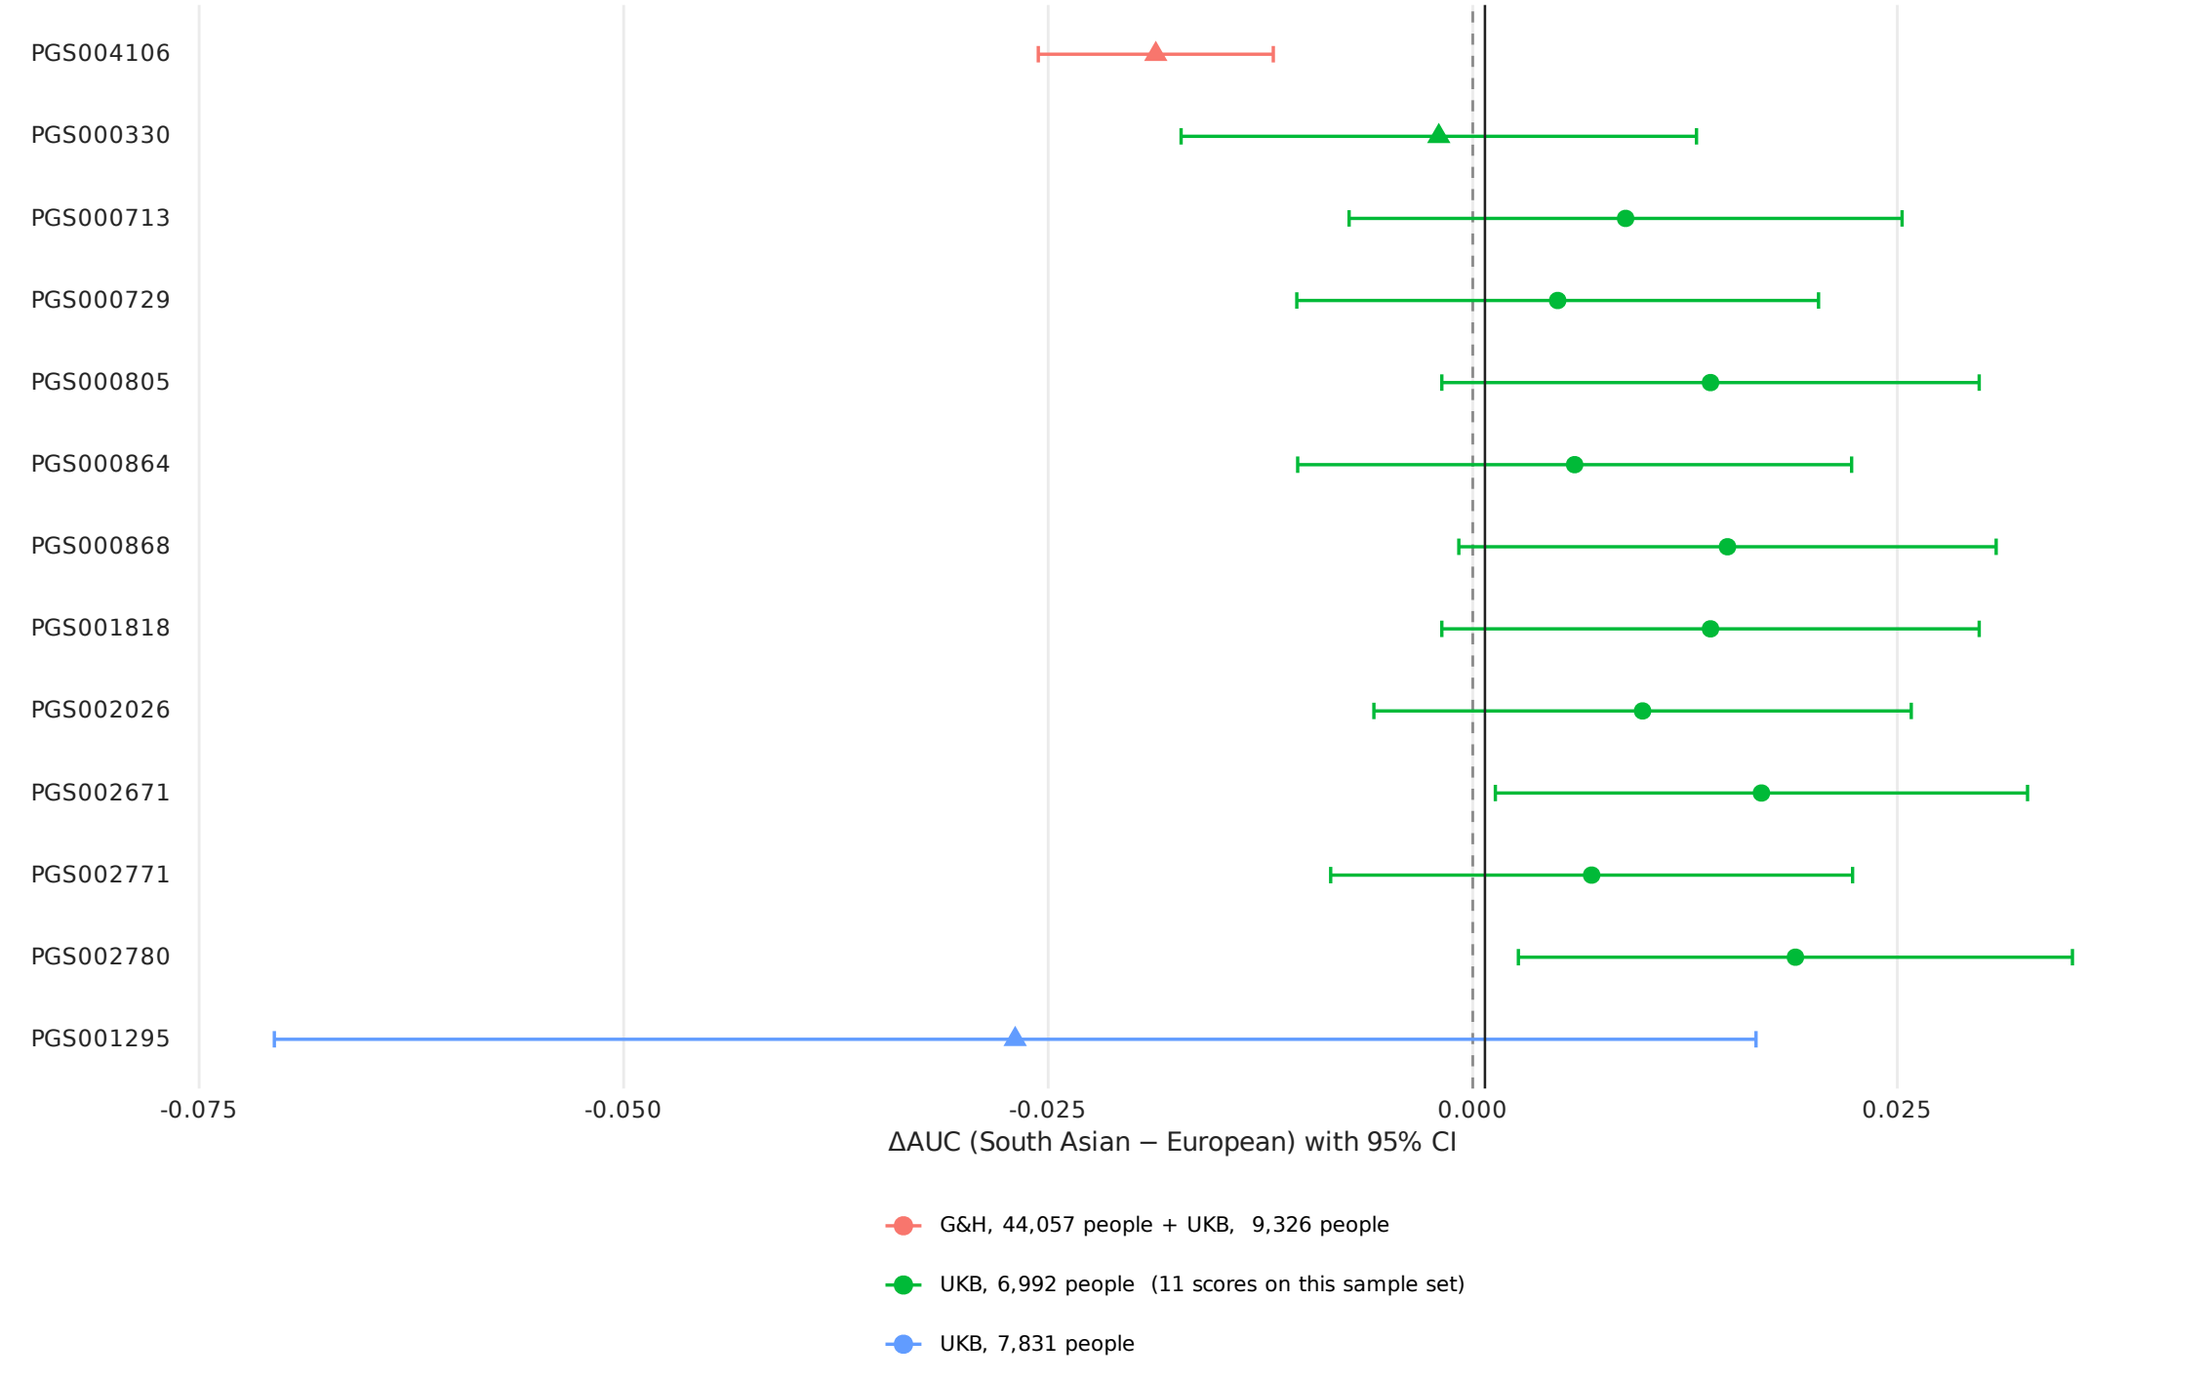
2. One of the nine. Eleven PGS share PSS011749, and two other target sample sets are in the comparison.

Type 2 diabetes, Europeans and South Asian participants, European-only training.

Triangles are the PGS kept for each target sample set. Circles are further PGS on a sample set that already has a triangle. The black line is All PGS IVW, the inverse-variance



The pool of thirteen is 0.0007 (-0.0032 to 0.0046) and includes 0. One PGS per target sample set leaves three values. Their pool is -0.016 (-0.022 to -0.010) and excludes 0.

On the page for Georg, lmer(AUC ~ ancestry + PGS + (1|cohort)) gives -0.010 for South Asian participants in this training set (-0.061 to 0.041). Here cohort means the sample set.

That number is an ancestry coefficient from the joint model. It is not a point on this axis. The interval includes 0.
