

Sensitivity: Δ AUC with vs without Hanley-McNeil recovered CIs (logit-scale SE as submitted)

22 of 28 cells remain estimable with reported CIs only; 0 sign flips; 0 changes in whether the 95% CI excludes zero.

k = number of PGS with a paired European/target estimate; * = 95% CI excludes zero.

'not estimable' = every PGS in the cell depended on a Hanley-McNeil recovered CI.
