

Dependence sensitivities on the delta-method Δ AUC
Significant cells: 19 fixed / 16 one-per-sample-set / 18 random effects; 14 significant in all three.

One PGS per target sample set: within each cell, scores sharing the same target sample set(s) are collapsed to one (lowest PGS ID).
Random effects: DerSimonian-Laird τ^2 across the k within-PGS Δ AUC values. k = PGS per cell (fixed-effect row); * = 95% CI excludes zero for that version.
